**ORGAN - AA and ORGAN - BA****1 - Abstract**

These programs allow the user to play any melody in the PDP-12, using the keyboard to produce the musical notes, which will be heard in the speaker.

The first version, AA, assigns a key to each note of a 4-octave range, which were named D01 to D05. Thus, the operator can play his melody like if he were at the organ.

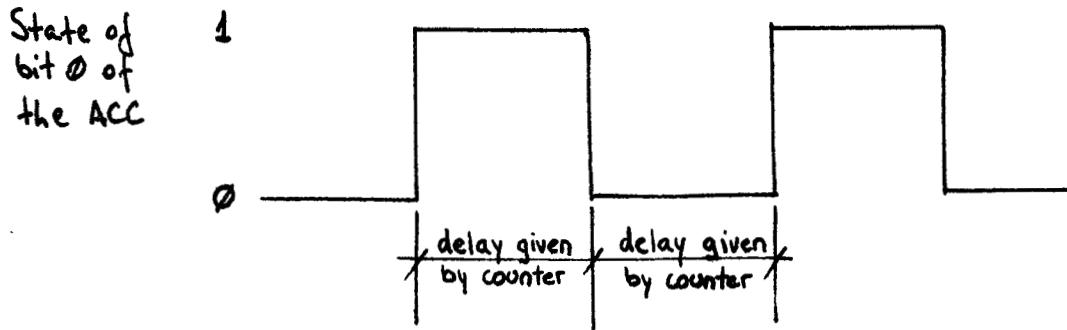

The second version, BA, is a simulation, since the series of notes of a known melody must be first stored in memory. As the operator strikes keys (anyone), the notes are retrieved from the list and played. A consecutive note will be retrieved only when a key is stroke.

In the second version, the operator does not need to know to play the piano - like keyboard, but is supposed to know the melody and the rhythm, to strike keys at the proper intervals.

**2 - ORGAN - AA - Description**

The sound is got in the speaker, which is driven by bit  $\emptyset$  of the Accumulator. The musical note depends on the frequency at which bit  $\emptyset$  changes its state.

One number has been defined for each musical note. This number is used as a counter to establish a delay between changes of the state of bit  $\emptyset$ :

Each time a key is stroke, the program takes the counter from the location pointed by PTR, which corresponds to the character read.

Initially, the program starts with a very low frequency, and then begins to interrogate the keyboard. No two notes can be played simultaneously. Striking "space" will suspend sound until another key is stroke.

### 3 - Operation ORGAN - AA

Starting address is 0020 in LINC MODE. Almost all keys will be active. See the keys and their corresponding counters in the table beginning in location TAB + 1.

Note that the last octave (D04 to D01) can be got pressing SHIFT and the numbers 1 to 0, and characters \* and =.

"Space" is active too, and is used to suspend sound until a new key is stroke.

To restart, press STOP - L MODE - I/O PRESET - START 20.

### 4 - Description ORGAN - BA

The table of definitions, which can be found in the first part of the listing of the program, gives for each note a mnemonic name and the correspondent counter.

For execution, the user should place his table of notes, expressed by their mnemonics, beginning in location "TAB". Then he should complete and load the program. The user's table of notes can extend up to location 7777, but normally the melodies should be much shorter.

Location 0017 is used as a pointer to the list of notes. It will point always to the address of the current note.

If the user has stored several different melodies in core, and wants to play one of them skipping the others, he should proceed as follows:

- Place the starting address of the subject list minus one, in location 17.
- Start the program at location 0023.

### 5 - Operation ORGAN - BA

Starting address: 0020 LINC MODE.

First the program will start with a very low frequency note, and begin to interrogate the keyboard. Each time any key is stroke, a new note (consecutive) will be retrieved from the list and make sound. When the operator strikes "SPACE" bar, the sound will be suspended until another key is stroke.

If the operator knows the melody and rhythm well, a very good simulation can be made. It will seem as if the operator were able to play the organ.

NOTE: For both programs: if a rather long modification is introduced, the counters defined here will possibly not be adequate. It should be observed that each counter is a preset value for the instruction ISZ. Once the value PREV is got in the ACC, the program enters a loop ISZ COUNT, JMP.-1. Thus, the COUNT is incremented from the initial value identified with the note, up to 7777. Once this loop has been executed, a half of the cycle of the square wave is completed. Then the program goes again to interrogate the keyboard. After some short routines, it enters again in the ISZ COUNT; JMP.-1 loop to complete the second half of the cycle. Then each half cycle will be composed

by:

- Time required by the routines to interrogate the keyboard, actualize the COUNTER, get the PREVIOUS value, add 4000 to change bit 0, deposit it as PREVIOUS value, etc.
- Time required by the loop ISZ COUNT; JMP.-l.

The counter is got as follows:

$$N = 4095 - \frac{(1000000/q) - 2L}{9.6}$$

where:

Q: Frequency of the note, in Hz.

L: Length of the accessory routines (those which are always done each time an ISZ COUNT; JMP.-l loop is executed), in microseconds.

N: Counter, in decimal base.

This counter must be converted to octal base.

\*\*\*=0\*\*\*
