## Section 1

# INTRODUCTION

## ABOUT THE MANUAL

Service documentation for the 4051 Graphic System is a two-part package of which this manual is the second part.

*4051 Service Manual, Volume 1 (070-2065-00)*

*4051 Service Manual, Volume 2 (070-2286-00)*

The first volume contains the text of the maintenance and service information, including assembly/disassembly procedures, circuit descriptions and troubleshooting guidelines. Volume 2 contains schematics, replaceable parts information, cables and wiring, and signal cross reference information.

## SYSTEM CONCEPTS

The 4051 Graphic System is illustrated in Fig. 1-1. It executes statements typed on the keyboard using the syntax of the BASIC interpretive computer language. Graphic and alphanumeric information can be stored on the crt display. An optional Communication Backpack can be installed to make the 4051 behave as an intelligent graphic terminal or to emulate one of the Tektronix Computer Display Terminals. A General Purpose Interface Bus (GPIB) is available and conforms to the IEEE Standard 488-1975 defining a standard interface for programmable instruments. An optional joystick can be connected to provide convenient graphic input capability. A Hard Copy Unit can also be connected to the system to directly transfer display information from the crt to photosensitive paper.

The 4051 Graphic System is built around a Motorola 6800 microcomputer system as illustrated by Fig. 1-2. The 6800 microprocessor unit (MPU) is the system controller, scheduler and primary logic device. Other system components include random access memory (RAM) to store BASIC programs and data in machine executable form. Read only memory (ROM) contains the BASIC interpreter and device communication codes. Peripheral interface adapters (PIAs) provide a processor interface to most of the devices comprising a 4051 Graphic System. The primary data linkages between components are shown as are the appropriate 4051 schematics (and backpack schematics) that provide the circuit details.

Detailed circuit descriptions can be found in the *4051 Service Manual, Volume 1*. Supplementary block diagrams are shown in the following figures to help you locate the desired or needed schematics.

Figure 1-3 shows the magnetic tape interface between the system PIAs and the tape drive board. The tape drive board and tape status hardware are illustrated in Fig. 1-4.

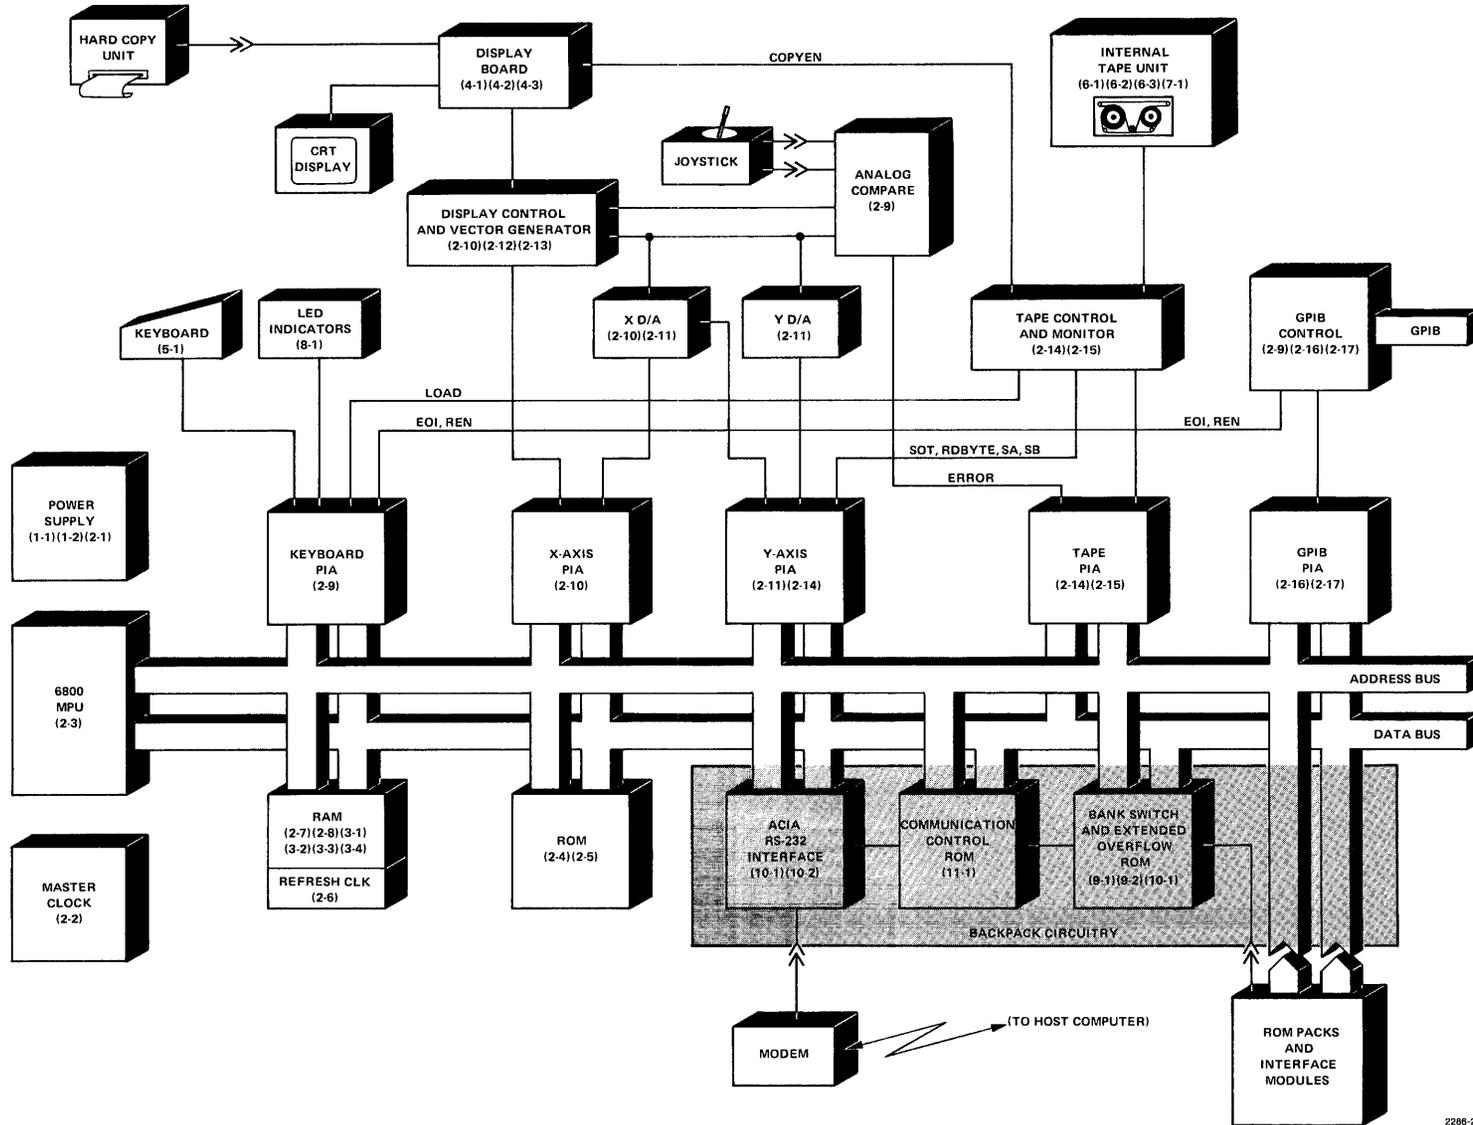

Fig. 1-2. 4051 Graphic System block diagram showing schematic sheet numbers in parenthesis.

2286-2

2286-3

# INTRODUCTION

**Fig. 1-4. Tape drive circuitry illustrating the tape status, tape drive and read/write circuits in detailed block diagram form.**

Figure 1-5 shows a detailed block diagram of display control circuits that use signals from PIAs to generate the analog signals required by the display board circuitry. The display board circuits are outlined in Fig. 1-6.

2286-5

Fig. 1-5. Display control block diagram.

# INTRODUCTION

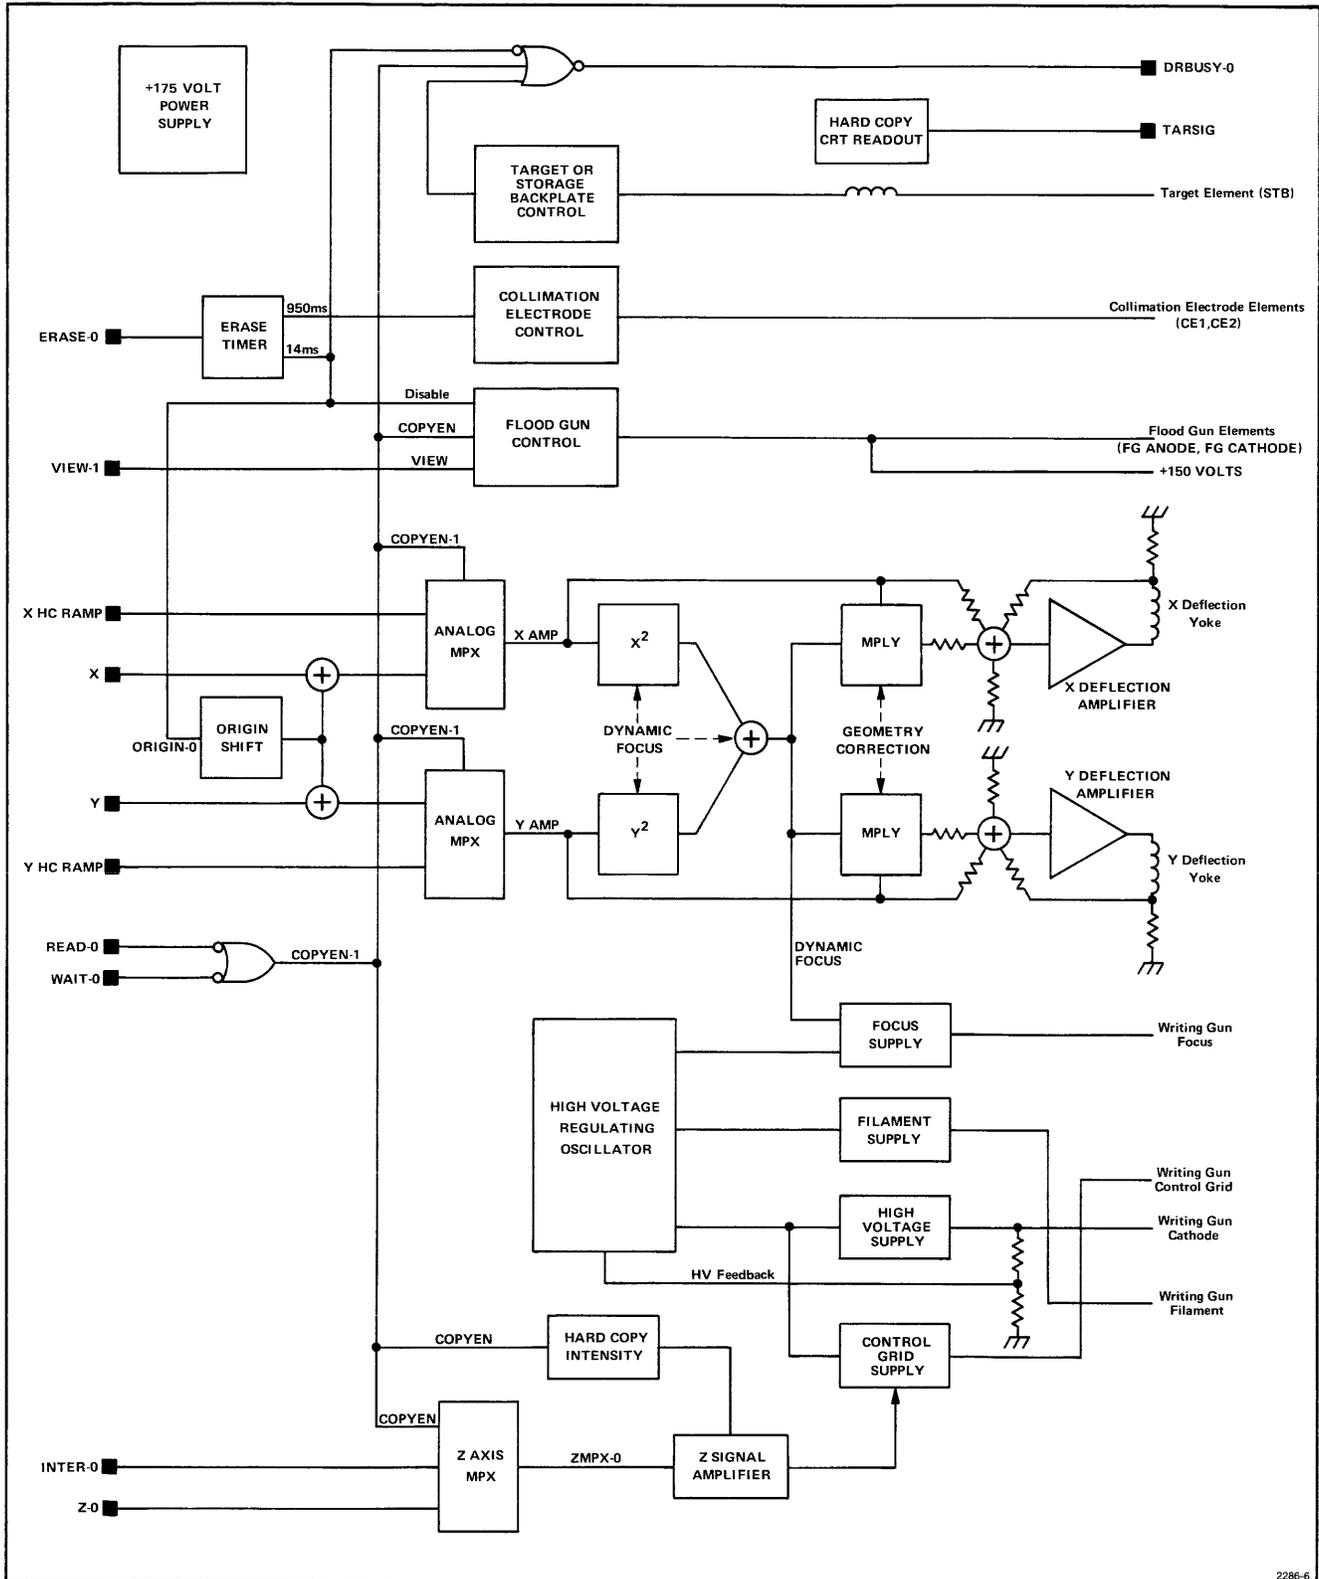

Fig. 1-6. Display unit block diagram.

The General Purpose Interface Bus (GPIB) circuitry is shown in Fig. 1-7. All signal lines are controlled by system firmware and the 6800 microprocessor. The block diagram shows the circuitry between the PIAs and the GPIB, including schematic sheet references.

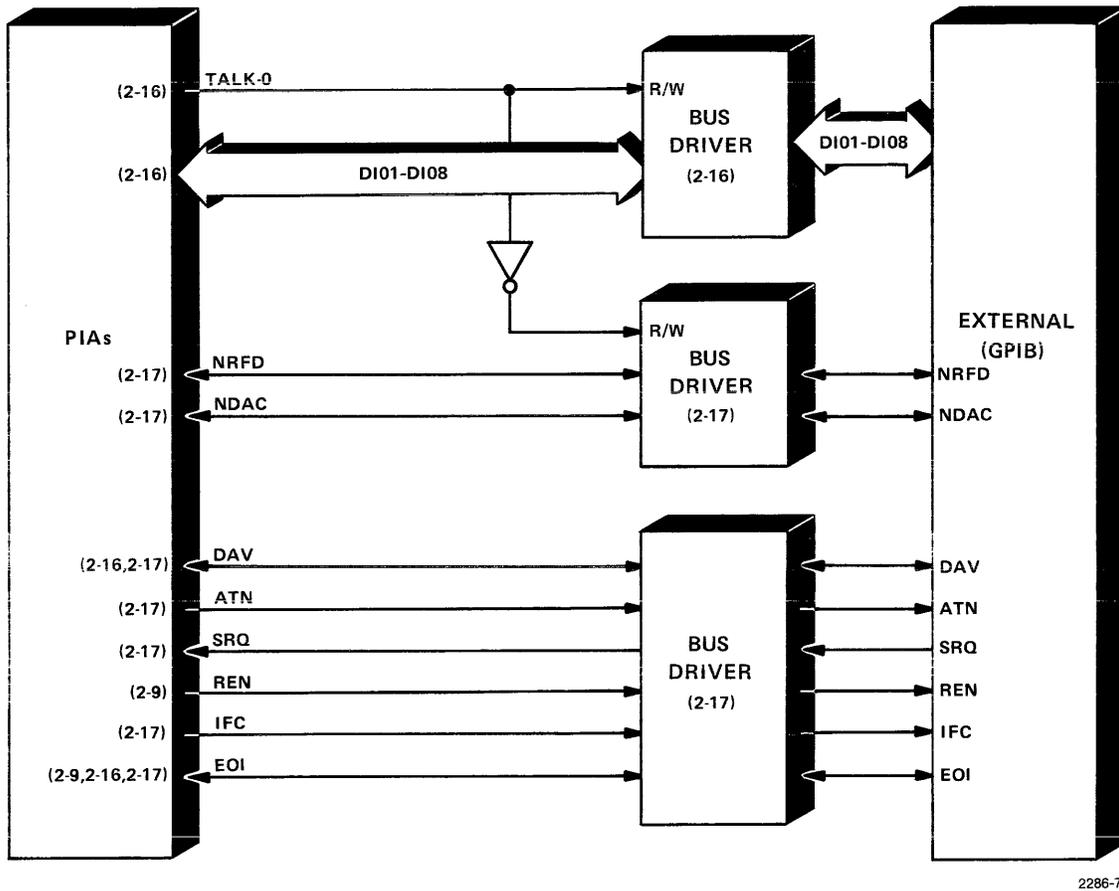

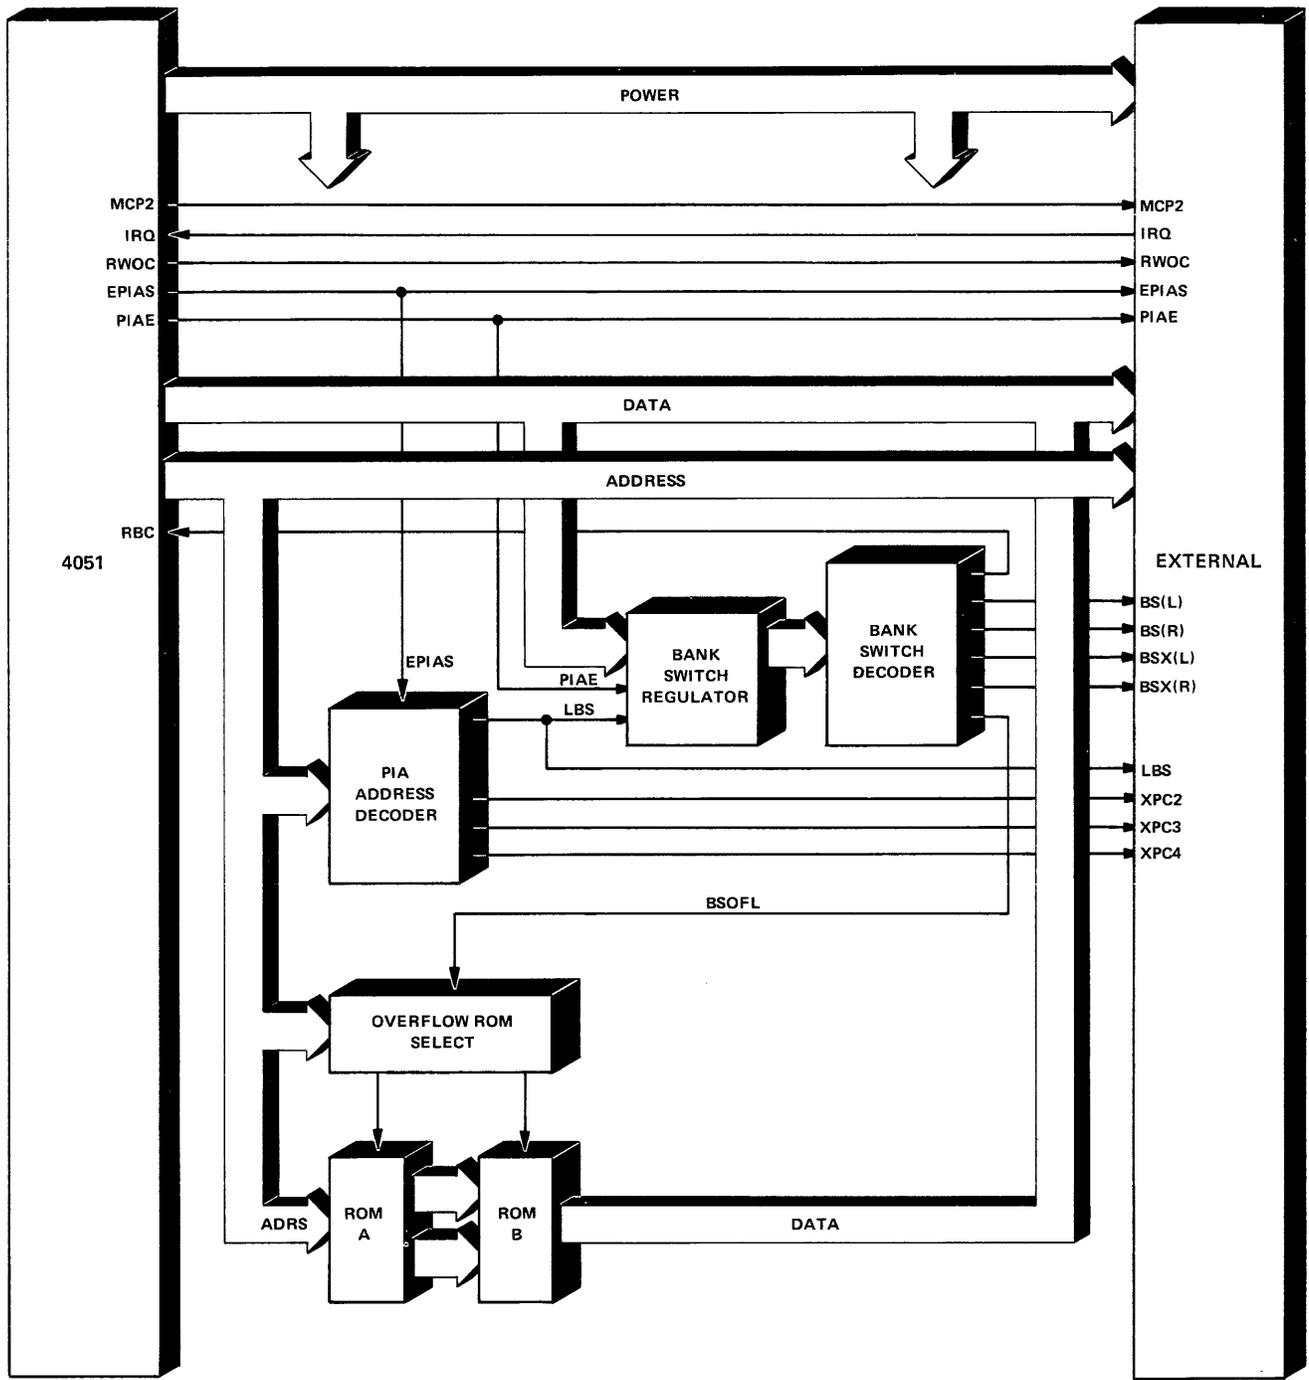

Fig. 1-7. General Purpose Interface Bus (GPIB) block diagram.

The Firmware Backpack circuitry is illustrated by Fig. 1-8. The backpacks contain a bank switch register that allows selected firmware backpacks and optional interfaces to be addressed by the microprocessor.

## TIMING

The following system timing diagrams (Figs. 1-9 and 1-10) are included here as a ready reference to system troubleshooting. Detailed description of the associated circuitry resides in Volume 1.

2286-8

Fig. 1-8. Block diagram Firmware Backpack circuitry.

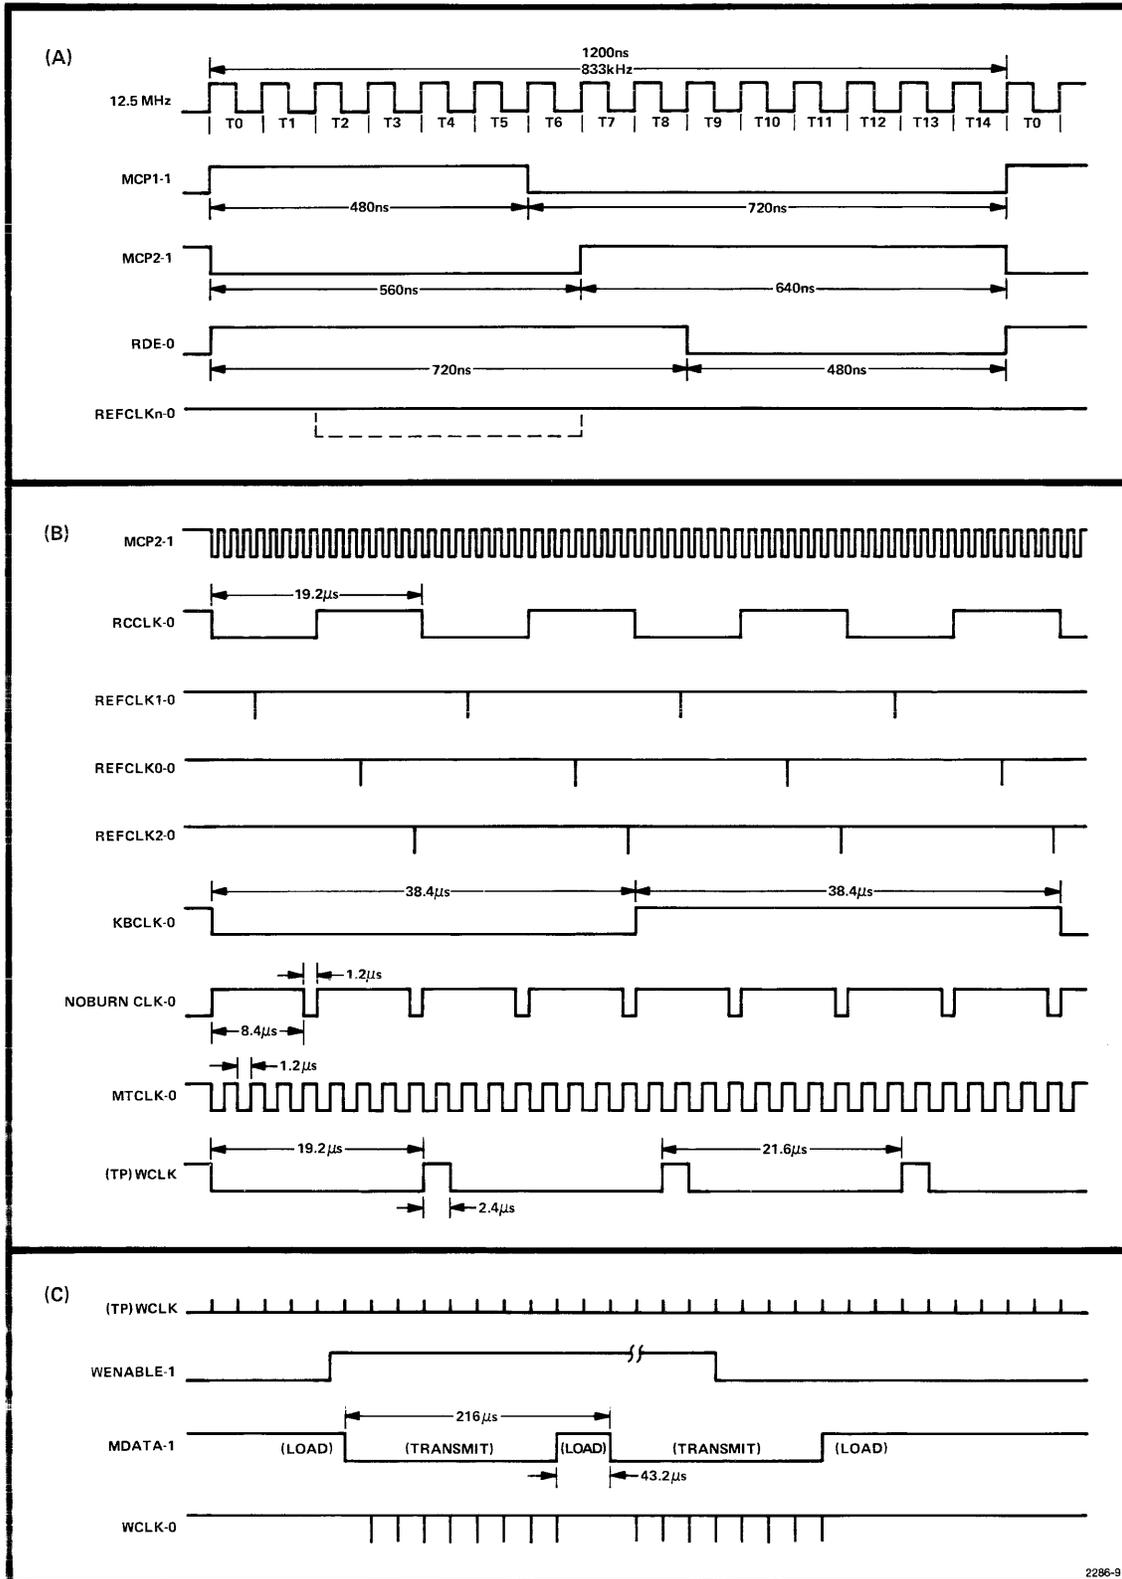

Fig. 1-9. 4051 Graphic System control timing: a) processor timing, b) memory refresh and system clocks, c) tape control timing.

## INTRODUCTION

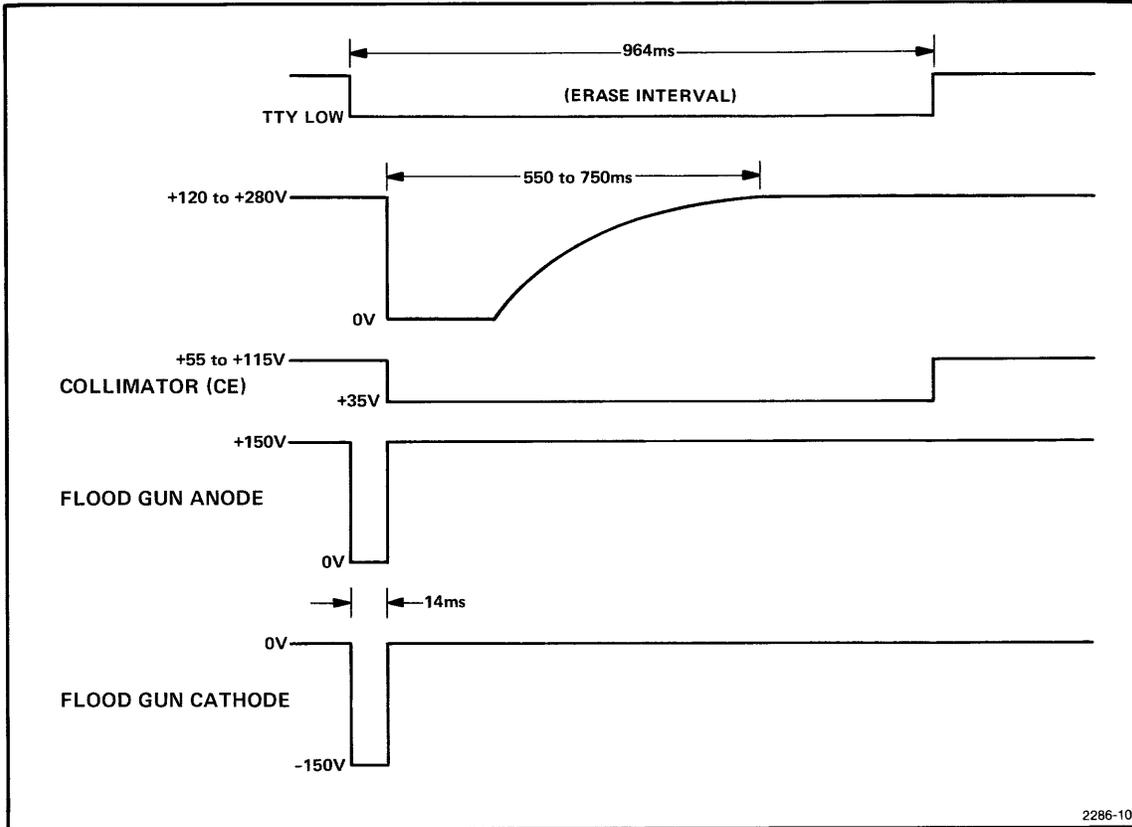

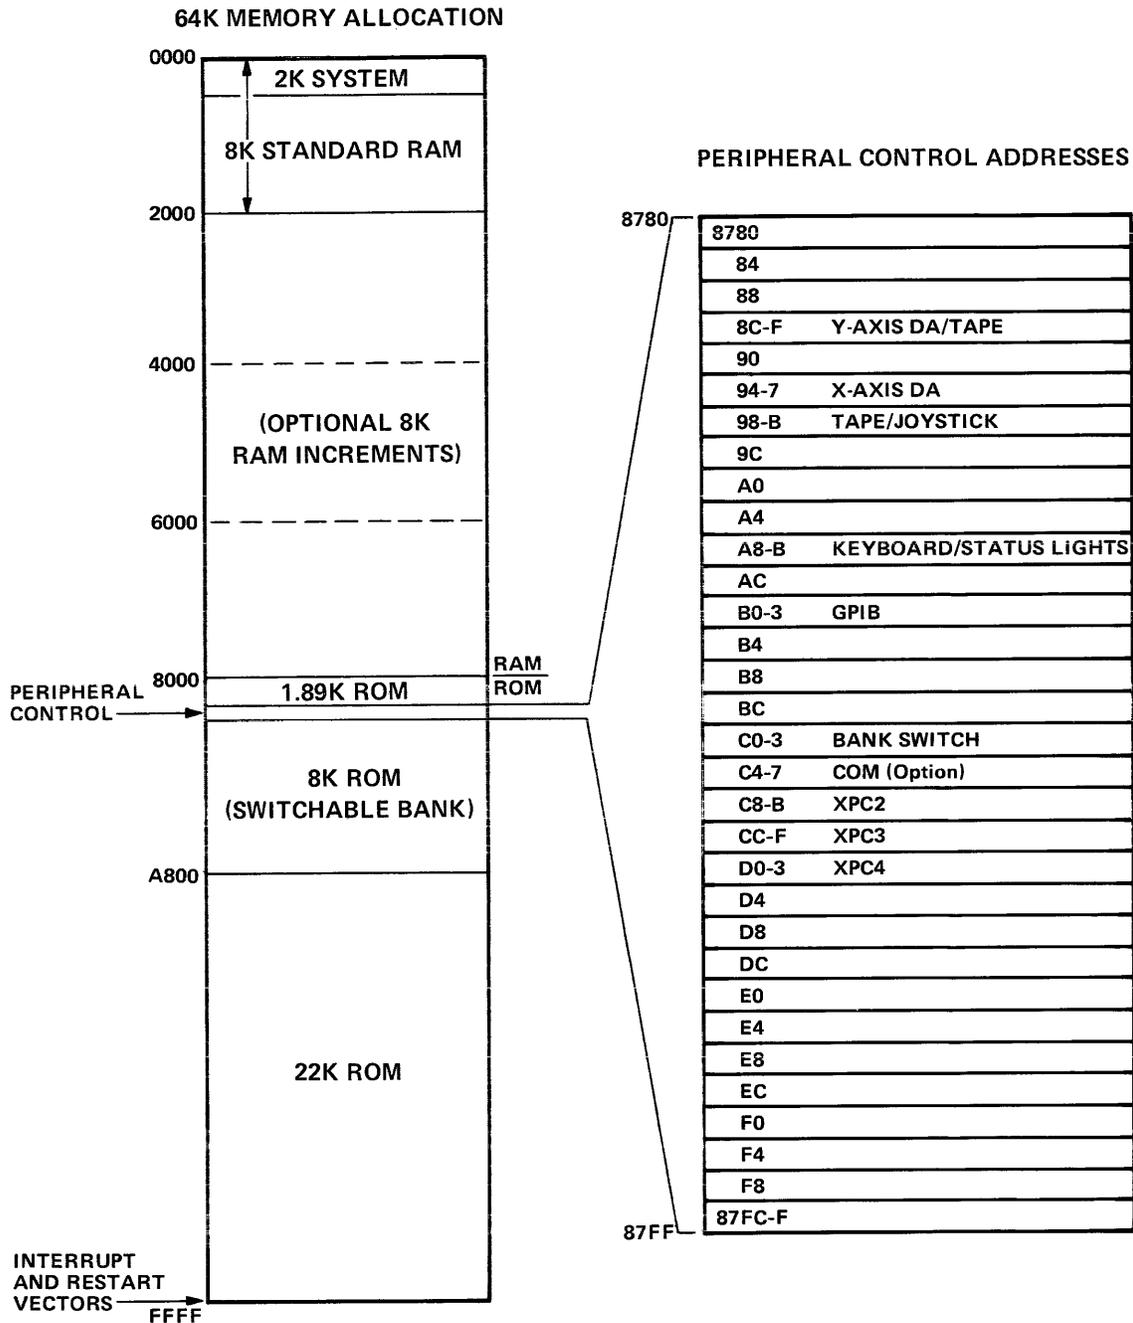

Fig. 1-10. Display erase timing and voltage waveforms.

## MEMORY ADDRESSING AND PIA DATA

Figure 1-11 is a memory address allocation map for the 4051 Graphic System. Following the address map are tables of peripheral interface adapters (PIAs) showing their data line and control line assignments.

DIVISION	ADDRESS BOUNDARIES
Standard RAM	0000-1FFF
Optional RAM	2000-7FFF
1.89K ROM	8000-877F
Peripheral Control	8780-87FF
8K Switchable Bank	8800-A7FF
22K ROM	A800-FFF7
Interrupt Vector	FFF8-FFF9
Restart Vector	FFFE-FFFF

## Section 2

# CROSS-REFERENCE DATA

This cross-reference list contains all signal mnemonics used in a 4051 Graphic System and the 4051 schematic sheets on which the signals are located. Once a signal name has been identified, locate the signal name in the following alphabetized list. The number pairs to the right indicate the schematic sheets on which this signal may be found. Table 2-1 specifies which circuit board and schematic sheets go together.

Table 2-1

### SCHEMATIC ASSIGNMENT CHART

1-X	Power Supply
2-X	CPU Board
3-X	Memory Board
4-X	Display Board
5-X	Keyboard
6-X	Tape Drive Board
7-X	Tape Status Board
8-X	Indicator Board
9-X	Firmware Backpack
10-X	Communications Interface
11-X	Communications ROM Board

## Section 3

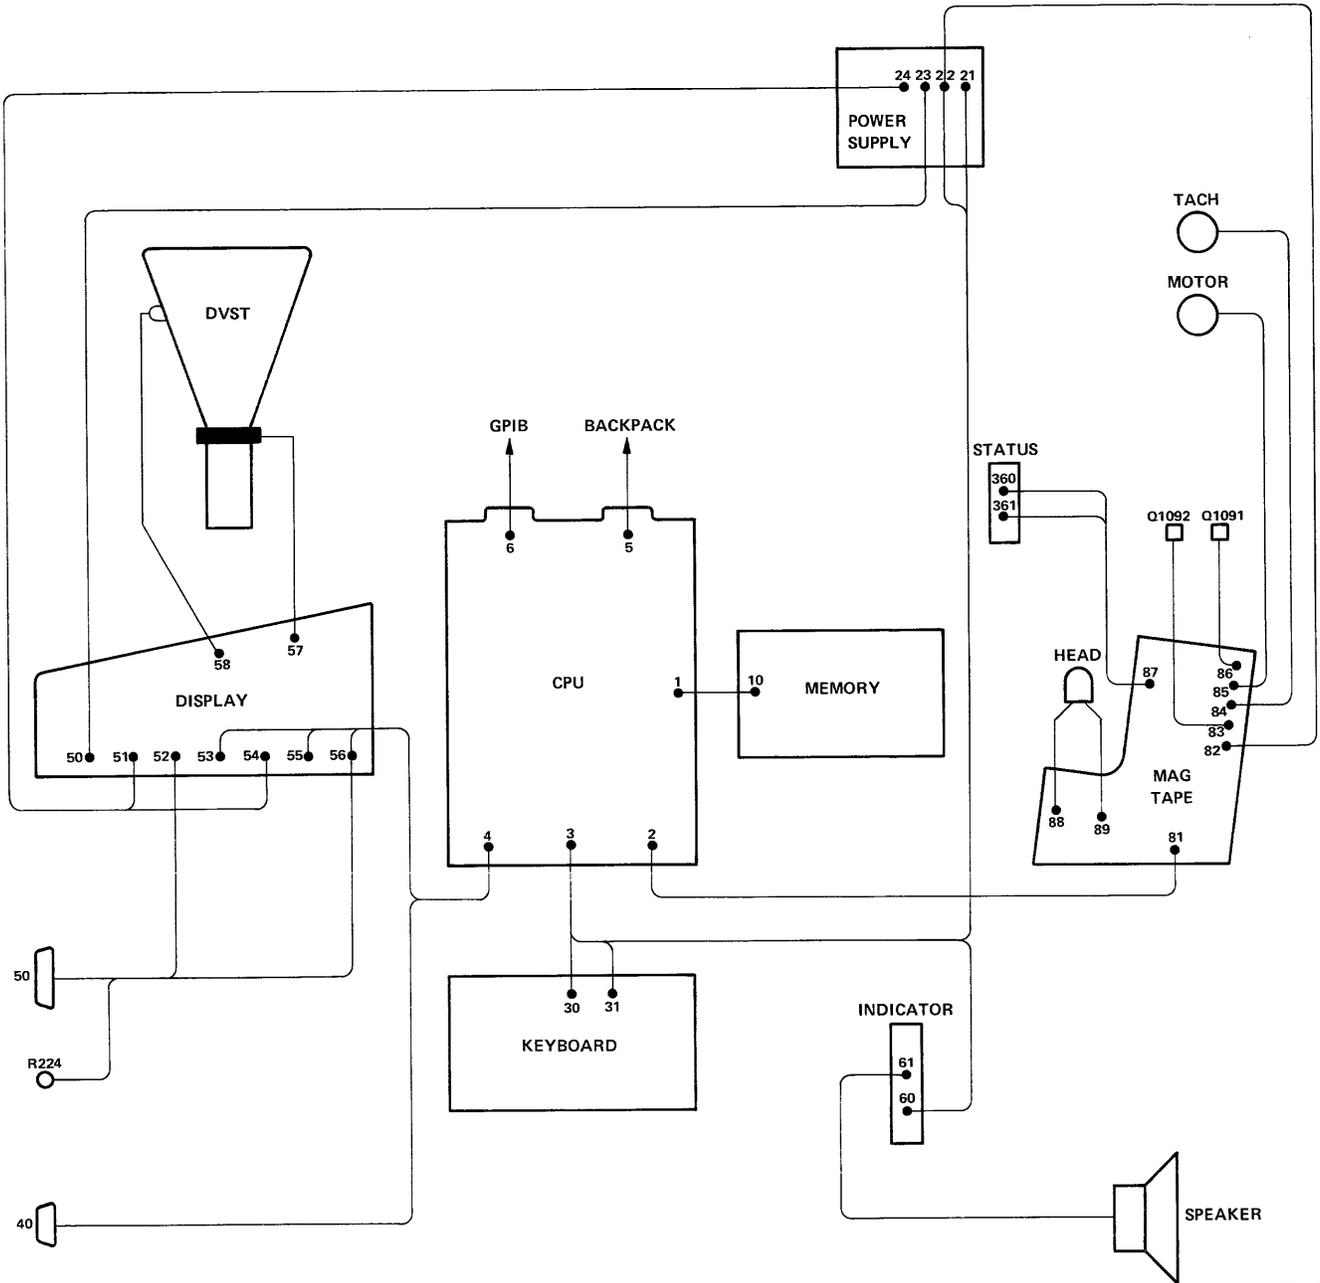

# WIRE HARNESS

This section contains wire harness information for 4051 Graphic Systems. Fig. 3-1 shows the approximate location of wire harness connectors and board locations throughout the system. The connector tables show the wire connections between connectors. A wire color code is given in numerical form according to Table 3-1. In many cases, the least significant digit of a connector number also corresponds to the color of the plug or jack that goes on that connector.

**Table 3-1**  
**WIRE COLOR INFORMATION**

<b>CODE</b>	<b>MEANING</b>
empty	ribbon cable—single color
N	no secondary color
1-2	1=primary color (Brown) 2=secondary color (Red)
0	BLACK
1	BROWN
2	RED
3	ORANGE
4	YELLOW
5	GREEN
6	BLUE
7	VIOLET
8	GRAY
9	WHITE

## 4051 SCHEMATICS

### Symbols and Reference Designators

Electrical components shown on the diagrams are in the following units unless noted otherwise:

- Capacitors = Values one or greater are in picofarads (pF).  
Values less than one are in microfarads ( $\mu$ F).
- Resistors = Ohms ( $\Omega$ ).

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

Abbreviations are based on ANSI Y1.1-1972.

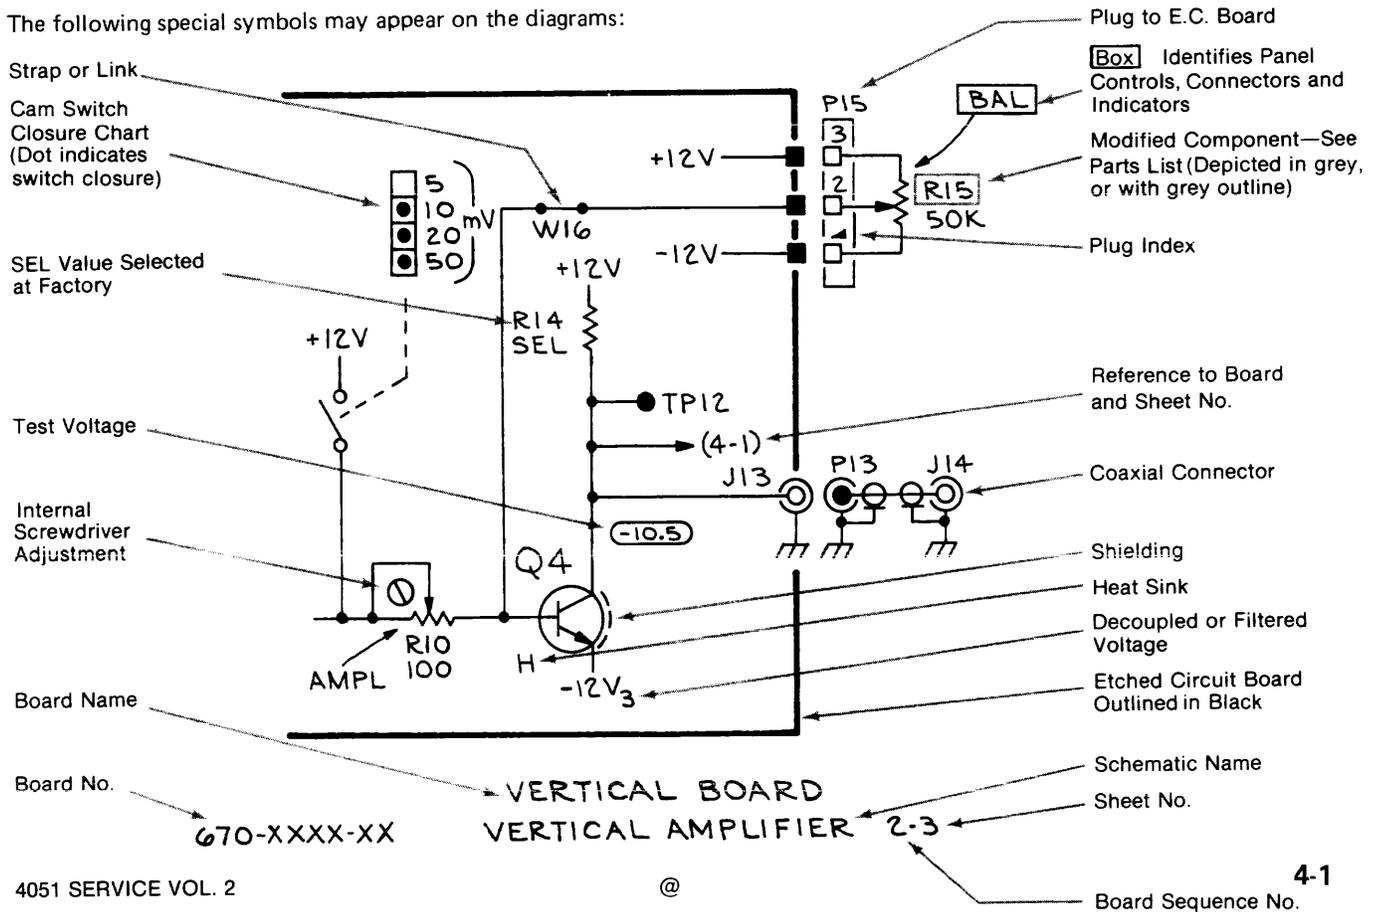

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

- Y14.15, 1966 Drafting Practices.
- Y14.2, 1973 Line Conventions and Lettering.
- Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

The following prefix letters are used as reference designators to identify components or assemblies on the diagrams.

A	Assembly, separable or repairable (circuit board, etc)	H	Heat dissipating device (heat sink, heat radiator, etc)	S	Switch or contactor
AT	Attenuator, fixed or variable	HR	Heater	T	Transformer
B	Motor	HY	Hybrid circuit	TC	Thermocouple
BT	Battery	J	Connector, stationary portion	TP	Test point
C	Capacitor, fixed or variable	K	Relay	U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
CB	Circuit breaker	L	Inductor, fixed or variable	V	Electron tube
CR	Diode, signal or rectifier	M	Meter	VR	Voltage regulator (zener diode, etc.)
DL	Delay line	P	Connector, movable portion	W	Wirestrap or cable
DS	Indicating device (lamp)	Q	Transistor or silicon-controlled rectifier	Y	Crystal
E	Spark Gap, Ferrite bead	R	Resistor, fixed or variable	Z	Phase shifter
F	Fuse	RT	Thermistor		
FL	Filter				

The following special symbols may appear on the diagrams:

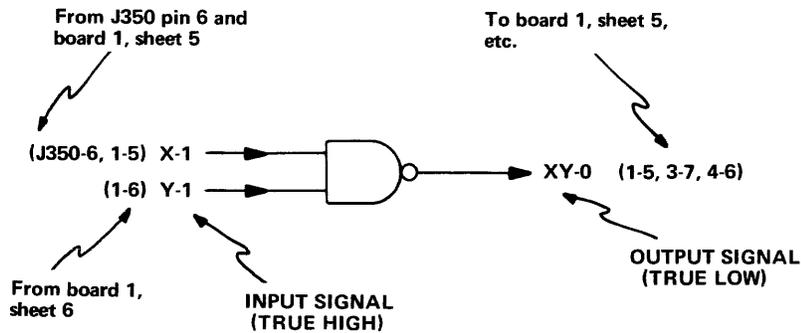

**1. TRUE HIGH and TRUE LOW Signals**

Signal names on the schematics are followed by -1 or -0. A TRUE HIGH signal is indicated by -1, and a TRUE LOW signal is indicated by -0.

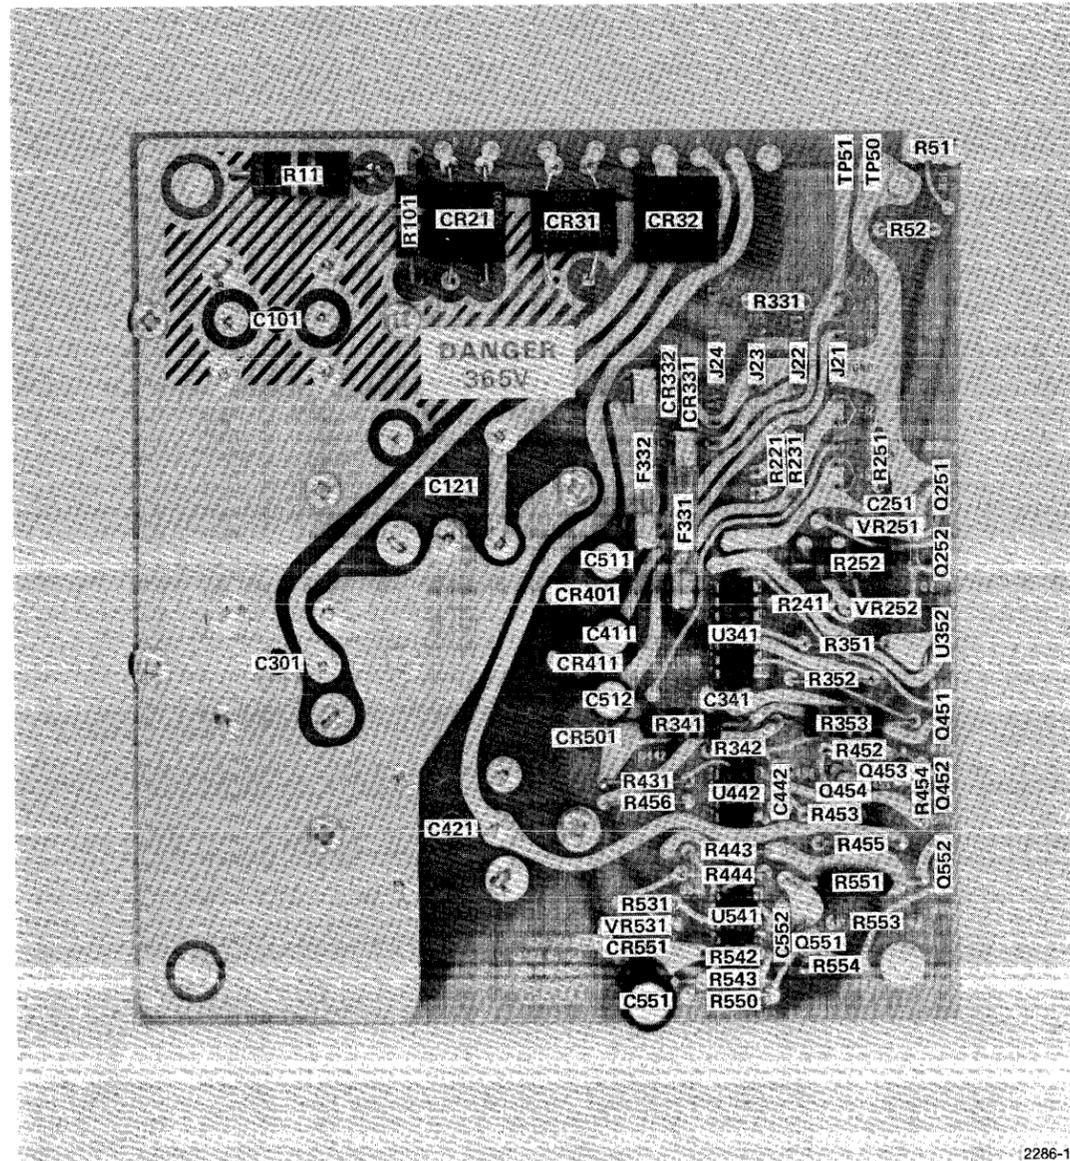

SIGNAL-1 = TRUE HIGH  
 SIGNAL-0 = TRUE LOW

**2. Cross-References**

Schematic cross-references (from/to information) are included on the schematics. The "from" reference only indicates the signal "source," and the "to" reference lists all loads where the signal is used. All from/to information will be enclosed in parenthesis.

# REPLACEABLE ELECTRICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number  
00X Part removed after this serial number

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## ABBREVIATIONS

ACTR	ACTUATOR	PLSTC	PLASTIC
ASSY	ASSEMBLY	QTZ	QUARTZ
CAP	CAPACITOR	RECP	RECEPTACLE
CER	CERAMIC	RES	RESISTOR
CKT	CIRCUIT	RF	RADIO FREQUENCY
COMP	COMPOSITION	SEL	SELECTED
CONN	CONNECTOR	SEMICOND	SEMICONDUCTOR
ELCTLT	ELECTROLYTIC	SENS	SENSITIVE
ELEC	ELECTRICAL	VAR	VARIABLE
INCAND	INCANDESCENT	WW	WIREWOUND
LED	LIGHT EMITTING DIODE	XFMR	TRANSFORMER
NONWIR	NON WIREWOUND	XTAL	CRYSTAL

# REPLACEABLE MECHANICAL PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

- X000 Part first added at this serial number
- 00X Part removed after this serial number

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```

1 2 3 4 5           Name & Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
    --- * ---
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
    --- * ---
Parts of Detail Part
Attaching parts for Parts of Detail Part
    --- * ---
    
```

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol --- \* --- indicates the end of attaching parts.

**Attaching parts must be purchased separately, unless otherwise specified.**

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

## Section 7

# FIRMWARE BACKPACK SCHEMATICS

### Symbols and Reference Designators

Electrical components shown on the diagrams are in the following units unless noted otherwise:

- Capacitors = Values one or greater are in picofarads (pF).  
 Values less than one are in microfarads ( $\mu$ F).
- Resistors = Ohms ( $\Omega$ ).

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

Abbreviations are based on ANSI Y1.1-1972.

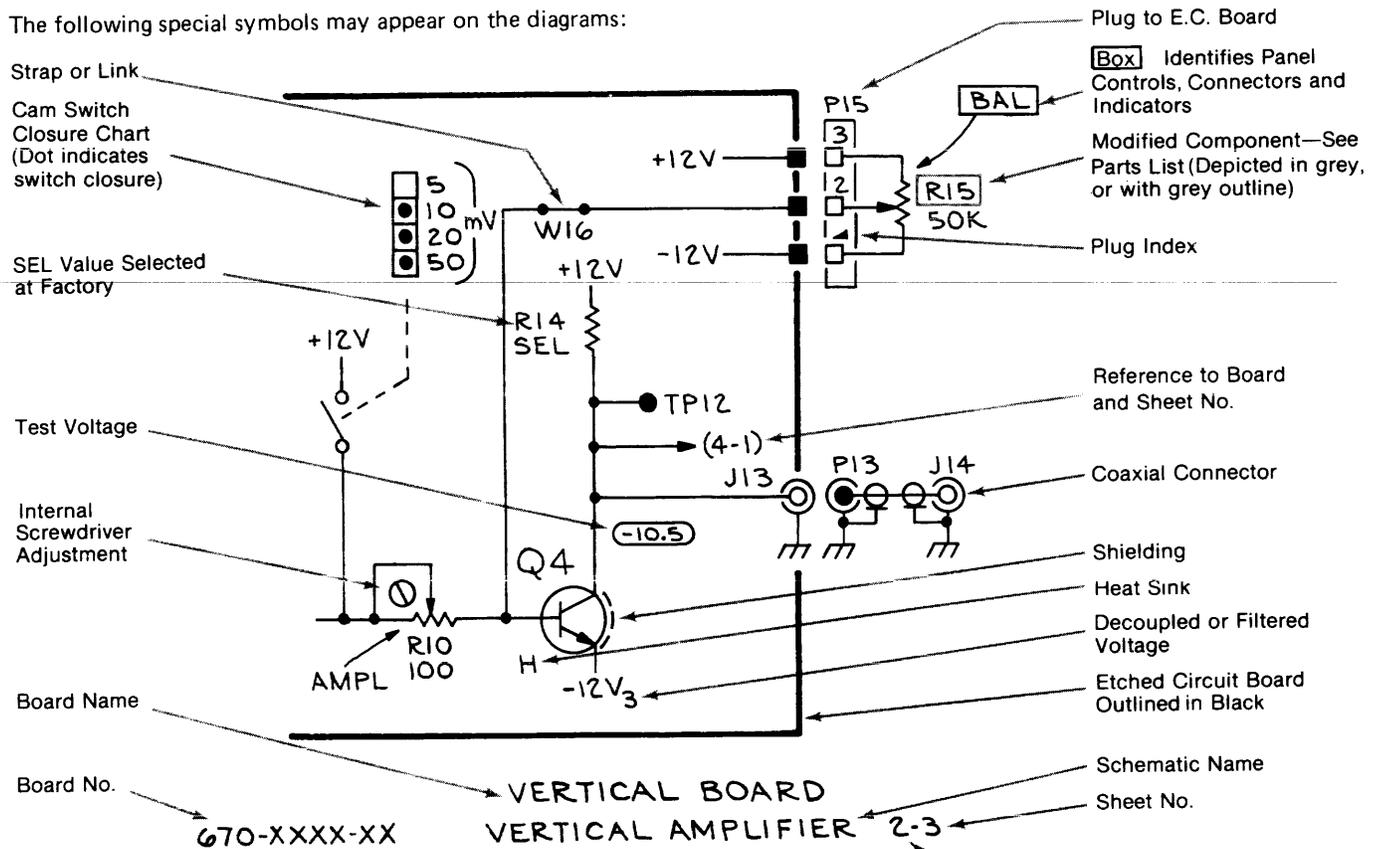

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

- Y14.15, 1966 Drafting Practices.
- Y14.2, 1973 Line Conventions and Lettering.
- Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

The following prefix letters are used as reference designators to identify components or assemblies on the diagrams.

A	Assembly, separable or repairable (circuit board, etc)	H	Heat dissipating device (heat sink, heat radiator, etc)	S	Switch or contactor
AT	Attenuator, fixed or variable	HR	Heater	T	Transformer
B	Motor	HY	Hybrid circuit	TC	Thermocouple
BT	Battery	J	Connector, stationary portion	TP	Test point
C	Capacitor, fixed or variable	K	Relay	U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
CB	Circuit breaker	L	Inductor, fixed or variable	V	Electron tube
CR	Diode, signal or rectifier	M	Meter	VR	Voltage regulator (zener diode, etc.)
DL	Delay line	P	Connector, movable portion	W	Wirestrap or cable
DS	Indicating device (lamp)	Q	Transistor or silicon-controlled rectifier	Y	Crystal
E	Spark Gap, Ferrite bead	R	Resistor, fixed or variable	Z	Phase shifter
F	Fuse	RT	Thermistor		
FL	Filter				

The following special symbols may appear on the diagrams:

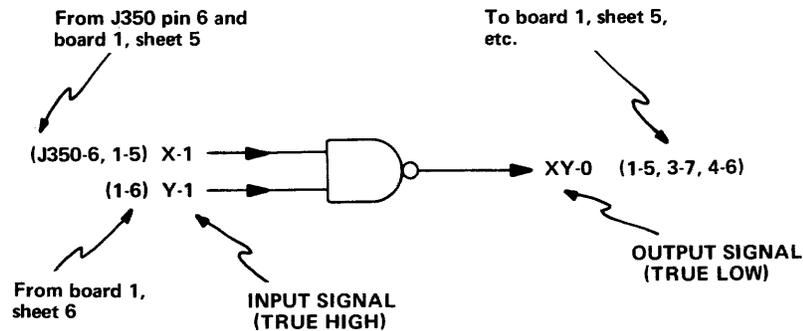

**1. TRUE HIGH and TRUE LOW Signals**

Signal names on the schematics are followed by -1 or -0. A TRUE HIGH signal is indicated by -1, and a TRUE LOW signal is indicated by -0.

SIGNAL-1 = TRUE HIGH  
 SIGNAL-0 = TRUE LOW

**2. Cross-References**

Schematic cross-references (from/to information) are included on the schematics. The "from" reference only indicates the signal "source," and the "to" reference lists all loads where the signal is used. All from/to information will be enclosed in parenthesis.

Board #	Name of Board	Schematic Section
1	Power Supply	4051 Schematics
2	CPU	
3	Memory	
4	Display	
5	Keyboard	
6	Tape Drive	
7	Tape Status	
8	Indicator Lights

10	Communication Interface	Communication Backpack
11	Communication ROM	

# REPLACEABLE PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number  
00X Part removed after this serial number

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```

1 2 3 4 5           Name & Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
  --- * ---
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
  --- * ---
• Parts of Detail Part
Attaching parts for Parts of Detail Part
  --- * ---

```

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol --- \* --- indicates the end of attaching parts.

**Attaching parts must be purchased separately, unless otherwise specified.**

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

# Section 9

## COMMUNICATION BACKPACK SCHEMATICS

### Symbols and Reference Designators

Electrical components shown on the diagrams are in the following units unless noted otherwise:

- Capacitors = Values one or greater are in picofarads (pF).  
Values less than one are in microfarads ( $\mu$ F).
- Resistors = Ohms ( $\Omega$ ).

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

Abbreviations are based on ANSI Y1.1-1972.

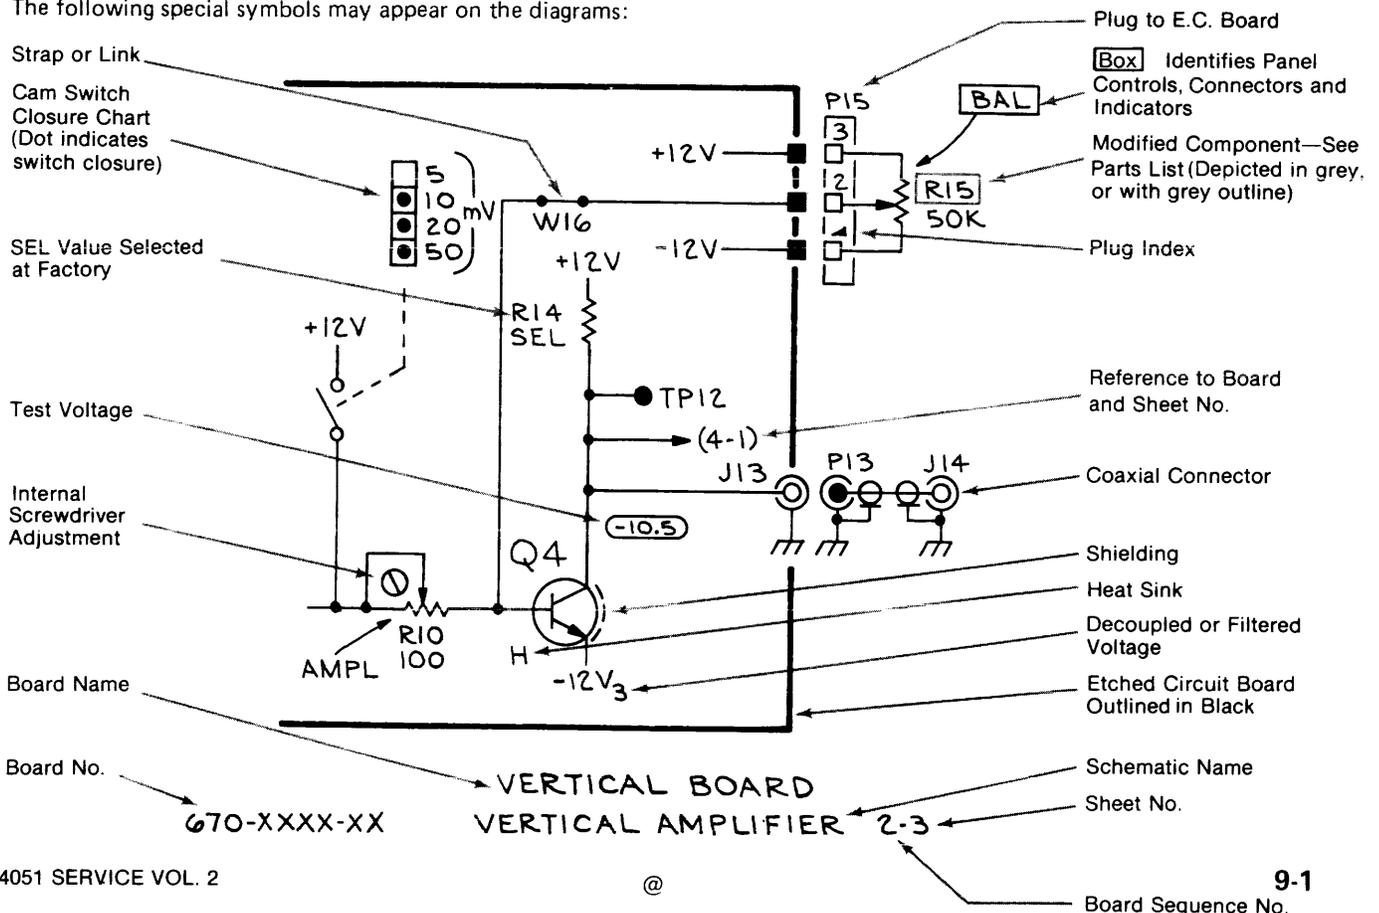

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

- Y14.15, 1966 Drafting Practices.
- Y14.2, 1973 Line Conventions and Lettering.
- Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

The following prefix letters are used as reference designators to identify components or assemblies on the diagrams.

A	Assembly, separable or repairable (circuit board, etc)	H	Heat dissipating device (heat sink, heat radiator, etc)	S	Switch or contactor
AT	Attenuator, fixed or variable	HR	Heater	T	Transformer
B	Motor	HY	Hybrid circuit	TC	Thermocouple
BT	Battery	J	Connector, stationary portion	TP	Test point
C	Capacitor, fixed or variable	K	Relay	U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
CB	Circuit breaker	L	Inductor, fixed or variable	V	Electron tube
CR	Diode, signal or rectifier	M	Meter	VR	Voltage regulator (zener diode, etc.)
DL	Delay line	P	Connector, movable portion	W	Wirestrap or cable
DS	Indicating device (lamp)	Q	Transistor or silicon-controlled rectifier	Y	Crystal
E	Spark Gap, Ferrite bead	R	Resistor, fixed or variable	Z	Phase shifter
F	Fuse	RT	Thermistor		
FL	Filter				

The following special symbols may appear on the diagrams:

**COMMUNICATION BACKPACK SCHEMATICS**

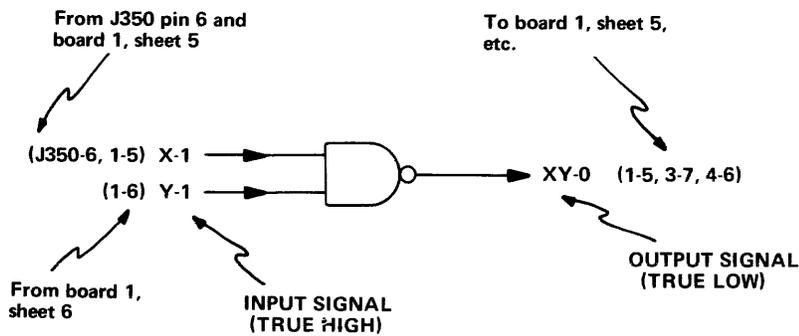

**1. TRUE HIGH and TRUE LOW Signals**

Signal names on the schematics are followed by -1 or -0. A TRUE HIGH signal is indicated by -1, and a TRUE LOW signal is indicated by -0.

SIGNAL-1 = TRUE HIGH  
 SIGNAL-0 = TRUE LOW

**2. Cross-References**

Schematic cross-references (from/to information) are included on the schematics. The "from" reference only indicates the signal "source," and the "to" reference lists all loads where the signal is used. All from/to information will be enclosed in parenthesis.

Board #	Name of Board	Schematic Section
1	Power Supply	4051 Schematics
2	CPU	
3	Memory	
4	Display

8	Indicator Lights	
9	Firmware Backpack	Firmware Backpack
10	Communication Interface	Communication Backpack
11	Communication ROM	

# REPLACEABLE PARTS

## PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number  
00X Part removed after this serial number

## FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

## INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```

1 2 3 4 5           Name & Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
  ---*---
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
  ---*---
Parts of Detail Part
Attaching parts for Parts of Detail Part
  ---*---

```

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol ---\*--- indicates the end of attaching parts.

**Attaching parts must be purchased separately, unless otherwise specified.**

## ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

# Section 11

## ROM PACK DATA SHEETS

This section contains data sheets on the optional ROM packs and special interfaces that can be used with the 4051 Graphic System. Each data sheet gives a brief description of the device, replaceable parts information, schematic diagram and any other pertinent service information (e.g. checksum data for ROMs).

There are data sheets in this section for the following:

021-0189-00 PRINTER INTERFACE  
4051R01 MATRIX FUNCTIONS ROM PACK  
4051R05 BINARY PROGRAM LOADER ROM PACK  
4051R06 EDITOR ROM PACK

Space is made available for you to enter the names or titles of other data sheets you may wish to add at some future time.

## Introduction For Printer Interface Data Sheet

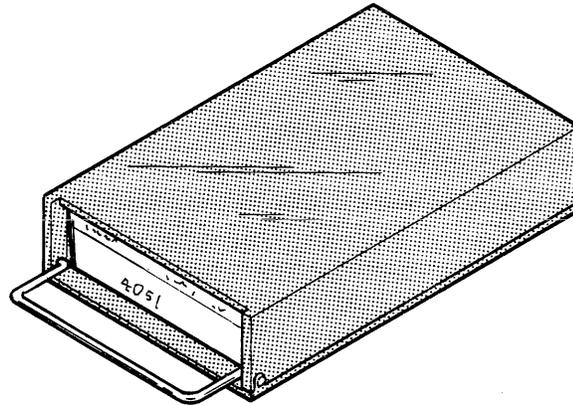

### 021-0189-00 PRINTER INTERFACE

The TEKTRONIX 021-0189-00 Printer Interface is a general purpose communications module that is used by the 4051 Graphic System to output data to any RS-232 compatible printing device (i.e., the TEKTRONIX 4641 Character Line Printer). The Printer Interface can only be used to output data.

The TEKTRONIX 4051 Graphic System uses the Printer Interface in conjunction with a Firmware Backpack (020-0147-00) or Communications Backpack (021-0188-00). The box portion of the Printer Interface is inserted into one of the ROM pack slots found in a backpack. The connector end is plugged into the RS-232 communications port of the printing equipment.

For details of operation, refer to the **4051 Option 10 RS-232 Printer Interface Manual**, part number 070-2119-00.

**4051R01  
4051R05  
4051R06**

The Tektronix 4051R01 Matrix Function, 4051R05 Binary Program Loader and the 4051R06 Editor are Rom Packs which add to the capabilities of the 4051 Graphic Systems. The ROM Packs do this without altering or disturbing the normal operation of the system or occupying any of the available RAM (Random Access Memory) storage space.

This Data Sheet provides supplementary service information for the ROM Packs. Included are Parts Lists, Schematics, and a Troubleshooting Data Table giving ROM checksum information. The ROM checksum is an 8-bit sum of all data bytes within a ROM chip ignoring arithmetic overflow.

**4051R01**  
**4051R05**  
**4051R06**

Refer to the 

<u>4051R01 Matrix Functions</u>
<u>4051R05 Binary Program Loader</u>
<u>4051R06 – 4051 Editor</u>

 manual for operator information. Refer to the 4051 Service manuals for detailed service information.

**RS232 PRINTER INTERFACE for 4051**  
Part No. 021-0189-00

The Tektronix 021-0189-00 Printer Interface is a general purpose communications module that is used by the 4051 Graphic System to output data to any RS232 compatible printing device (i.e. the Tektronix 4641 Character Line Printer). The Printer Interface can only be used to output data.

The Tektronix 4051 Graphic System uses the Printer Interface in Conjunction with a Firmware Backpack (020-0147-00) or Communications Backpack (021-0188-00). The box portion of the Printer Interface is inserted into one of the ROM pack slots found in a backpack. The connector end is plugged into the RS232 communications port of the printing equipment.

For details of operation, refer to the 4051 Option 10 RS232 Printer Interface Manual, part number 070-2119-00.

021-0189-00

## Appendix A

# INDEX OF SIGNAL NAMES

Interpretation of true and false logic states on the schematic diagrams uses this convention. Whenever a signal is followed by a dash one (NAME-1), the voltage is logically *high* for the signal to be true. Whenever a signal is followed by a dash zero (NAME-0), the voltage is logically *low* for the signal to be true.

AB0 thru AB15	<b>ADDRESS BUS LINES</b> These lines comprise the address bus. Data on the address bus determines which memory location or peripheral interface is to be activated.
ABA	<b>ADDRESS BUS AVAILABLE</b> This signal is the buffered bus available signal from the microprocessor. The true state specifies that the microprocessor is not using the address bus and that any other device may use the bus at this time. Memory refresh activity occurs at times when ABA is true. The 4051 system test fixture uses this signal to enable memory input/output operations when the microprocessor is halted.
ADOT	<b>ALPHANUMERIC DOT</b> This signal causes the display of a stored dot in the drawing of a printable character on the crt.
ANODE	<b>ANODE</b> This is a voltage line controlling the flood guns. When the display is in view mode, the anode voltage is +150 volts dc. When the display is in hold mode, the anode voltage alternates between +150 volts and zero volts, turning the flood guns on and off, to maintain the display of information on the crt.
ATN	<b>ATTENTION</b> This signal is activated by the 4051 when it is transmitting multiline interface messages over the General Purpose Interface Bus (GPIB). Only an active controller (4051 assumes it is the only controller) asserts ATN. When ATN is true, data on the data lines DIO1 thru DIO8 is interpreted as a talk address, listen address, untalk, unlisten,

## APPENDIX A

or any other multiline interface message specified in the IEEE Standard 488-1975 (IEEE Standard Digital Interface for Programmable Instrumentation. When ATN is false, the assigned talker can send device dependent information over the data lines DIO1 thru DIO8.

BIAS	<p><b>BIAS</b></p> <p>This voltage is generated by deflection amplifier circuitry on the display board to establish four constant current sources for proper display operation. Two of the current sources enable operation of the deflection amplifier outputs. The other two enable the multiplexing of crt deflection control between the cpu board and an optional Hard Copy Unit.</p>
BIAS	<p><b>BIAS</b></p> <p>This voltage is generated in the digital-to-analog circuitry on the cpu board to bias the current summing amplifiers of the digital-to-analog converters in their active region.</p>
BREAK	<p><b>BREAK</b></p> <p>This signal is used to light the BREAK light. This light being on indicates that program execution will halt at the completion of the current BASIC program language statement, at which time the BREAK light will go out.</p>
BSCOM	<p><b>BANK SWITCH COMMUNICATION</b></p> <p>This signal is generated by the banks switch data decoder to enable an 8K bank of read only memory (ROM) that contains code to govern RS-232 communication activity. To activate BSCOM, the hexadecimal data (10) must be loaded into the bank switch data register. LBS is active when the bank switch data register is addressed. The bank switch data register is located in the backpack.</p>
BS(L)	<p><b>BANK SWITCH LEFT</b></p> <p>This signal is generated by the bank switch data decoder to enable an 8K bank of read only memory (ROM) residing in the left backpack slot. The bank switch data register is located in the backpack.</p>
BS(R)	<p><b>BANK SWITCH RIGHT</b></p> <p>This signal is generated by the bank switch data decoder to enable an 8K bank of read only memory (ROM) residing in the right backpack slot. The bank switch data register is located in the backpack.</p>

BSX(L)	<p><b>BANK SWITCH EXPANSION LEFT</b></p> <p>This signal is generated by the bank switch data decoder to enable an 8K bank of read only memory (ROM) that resides in any of 8 slots in an optional ROM Expander Unit. The particular expander slot is determined by the 3 least significant bits of data loaded into a bank switch register.</p>
BSX(R)	<p><b>BANK SWITCH EXPANSION RIGHT</b></p> <p>This signal is generated by the bank switch data decoder to enable an 8K bank of read only memory (ROM) that reside in any of 8 slots in an optional ROM Expander Unit. The particular expander slot is determined by the 3 least significant bits of data loaded into a bank switch register.</p>
BUFCLK	<p><b>BUFFER CLOCK</b></p> <p>This signal is used to strobe data into the digital-to-analog converter data registers. It restarts a 90 second view mode timer. And, if vectors are to be drawn, it initiates a 3.7 millisecond pulse (VPULSE) used to time vector draws.</p>
BUSY	<p><b>BUSY</b></p> <p>This signal lights the BUSY light to indicate that the 4051 is busy transferring or processing data. BUSY is also driven by a programmed square wave to cause an audio tone at the speaker.</p>
CBACIA	<p><b>COMMUNICATION BACKPACK ACIA</b></p> <p>This signal is a line from an address asynchronous communication interface adapter is being addressed.</p>
CTRL	<p><b>CONTROL</b></p> <p>This signal is generated by pressing the CONTROL or CTRL key on the keyboard.</p>
COPY	<p><b>COPY</b></p> <p>This signal is generated by programming to initiate hard copy activity. It is also asserted when the MAKE COPY key on the keyboard is pressed.</p>
COPYEN	<p><b>COPY ENABLE</b></p> <p>This signal is generated by the OR of READ and WAIT signals from an optional Hard Copy Unit enabling the Hard Copy Unit to control circuitry on the display board. When the COPYEN signal is true, the Hard Copy Unit is either producing a hard copy or waiting to produce a hard copy of information on the crt.</p>

COPYEN is driven false whenever the internal magnetic tape drive is in motion, preventing the Hard Copy Unit from simultaneously controlling the display circuitry. Since both the crt display and tape drives are large consumers of energy, and that there is limited power from the power supply, a requirement exists that the display deflection amplifiers and tape motors cannot be simultaneously active.

CS

CHIP SELECT

This signal is generated by the MCP2 clock to select random access memory (RAM) circuits for read and write operations only when MCP2 is true. When MCP2 is false, memory refresh operations may occur. CS is the inverse of MCP2.

CTS

CLEAR TO SEND

When the 4051 acts as a data set, the signal transmitted at pin 5 of the RS-232 interface on the Communication Backpack enables a computer terminal to send data to the 4051.

When the 4051 acts as a data terminal, CTS becomes **Request To Send** on pin 4 of the RS-232 communication cable. It then notifies data communication equipment that the 4051 wishes to transmit data.

DAV

DATA VALID

The true state of this signal specified that data on the general purpose interface bus (GPIB) data lines (DIO1 thru DIO8) is valid. The 4051 places a true signal on DAV whenever data or remote interface messages are placed on the data lines by the 4051. DAV should remain asserted until NDAC goes false.

The 4051 cannot issue DAV if NRFD is true. A true on NRFD does not remove an already valid DAV signal.

The 4051 cannot issue DAV if it is a listener on the GPIB.

DB0 thru DB7

DATA BUS

These are the bi-directional data bus lines between the microprocessor and all memory and interface devices in the 4051.

DBE

DATA BUS ENABLE

This signal is an input to the microprocessor to enable the microprocessor to output information on the data bus. DBE is actually the phase two microprocessor clock MCP2. When high, the microprocessor can write data to the data bus, when low, memory refresh activity and other data functions can make use of the data bus.

DCD	<p><b>DATA CARRIER DETECT</b></p> <p>When the 4051 acts as a data set, the signal transmitted at pin 8 of the RS-232 interface on the Communication Backpack enables a remote terminal to send and receive data on the interface.</p> <p>When the 4051 acts as a data terminal, DCD becomes <b>Data Terminal Ready</b> on pin 20 of the RS-232 communication cable. It tells data communication equipment that the 4051 is ready to send or receive data over the RS-232 interface.</p>
DELAY IN	<p><b>DELAY INPUT</b></p> <p>This is a general purpose trigger signal derived from the selected operation trigger (SOT) signal. DELAY OUT is triggered by DELAY IN going high. DELAY OUT remains high for 40 microseconds after being triggered by DELAY IN.</p>
DELAY OUT	<p><b>DELAY OUTPUT</b></p> <p>This signal is a general purpose timing pulse of 40 microseconds in duration generated by a one shot on the tape drive board. DELAY OUT is triggered by the DELAY IN signal from the cpu board.</p>
DIO1 thru DIO8	<p><b>DATA IN AND OUT BUS</b></p> <p>These are the bi-directional data lines found on the general purpose interface bus (GPIB).</p>
DRBUSY	<p><b>DIRECT READOUT BUSY</b></p> <p>This signal goes true any time the display is busy (during an erase cycle or creating a hard copy). DRBUSY notifies the microprocessor that the cpu is involved in a time-consuming task. It also ensures that the flood guns are active when performing a page erase function or a hard copy operation.</p>
DRTAPE	<p><b>DRIVE TAPE</b></p> <p>This signal is generated by the microprocessor through a peripheral interface adapter to turn the tape unit motor on and off. When true, the tape motor is turned on; when false, the tape motor is turned off.</p>
DSR	<p>When the 4051 acts as a data set, the DSR signal transmitted on pin 6 of the RS-232 connector on the Communication Backpack tells the terminal that the 4051 is powered up and ready to operate.</p> <p>When the 4051 acts as a data terminal, the passive high has no affect on the DSR signal transmitted by the data communication equipment. DSR is ignored.</p>

## APPENDIX A

DTR	<p><b>DATA TERMINAL READY</b></p> <p>When the 4051 acts as a data set, the signal received on pin 20 of the RS-232 connector of the Communication Backpack tells the 4051 that a data terminal is powered up and ready for operation.</p> <p>When the 4051 acts as a data terminal, DTR becomes <b>Data Carrier Detect</b> on pin 8 of the RS-232 communication cable. It then notifies the 4051 that a data set is powered up and that a communication link has been established.</p>
DYNAMIC FOCUS	<p><b>DYNAMIC FOCUS</b></p> <p>This analog voltage is generated by the deflection amplifiers on the display board to provide correction to compensate for the physical characteristics of the crt. The correction voltage is proportional to <math>(X \text{ deflection})^2 + (Y \text{ deflection})^2</math>.</p>
EMI0 thru EMI7	<p><b>EXPANDED MEMORY INPUTS</b></p> <p>These signal lines are an extension of the bi-directional data bus used to provide data to be written into random access memory (RAM) devices on the expanded memory board within the 4051.</p>
EMO0 thru EMO7	<p><b>EXPANDED MEMORY OUTPUTS</b></p> <p>These signal lines are the output data bus from the random access memory (RAM) devices. During RAM read operations, data on the expanded memory output lines is strobed onto the 4051's bi-directional data bus.</p>
EOI	<p><b>END OR IDENTIFY</b></p> <p>This signal is sent true by an assigned talker on the general purpose interface bus (GPIB) to signal the end of data. Since parallel poll operations are not implemented in the 4051, the identify function of EOI is not implemented. During normal bus operation, EOI accompanies the last data byte to be transmitted.</p>
EPIAS	<p><b>EXTERNAL PERIPHERAL INTERFACE ADAPTER SELECT</b></p> <p>This signal is generated by the read only memory (ROM) page decoder and goes true whenever data on the address bus specifies that a valid external peripheral address may be present. External peripheral interface adapters (PIAs) are optional interfaces in ROM Pack cartridges that are inserted into backpack slots.</p>
ERASE	<p><b>ERASE</b></p> <p>This signal is generated on the cpu board to initiate an erase cycle on the display board.</p>

FAST	<p><b>FAST</b></p> <p>This signal is generated on the cpu board to determine the operating speed of the tape drive motor. When FAST is true, a tape speed of 90 inches per second is enabled. When FAST is false, the normal read/write tape speed of 30 inches per second is enabled.</p>
FICG	<p><b>FIND INTERCHARACTER GAP</b></p> <p>This signal enables the intercharacter gap (ICG) detecting circuitry during magnetic tape read operations. A true state enables the detection of file marks and record marks when the tape is operating at normal speed.</p>
FILFND	<p><b>FILE FOUND</b></p> <p>This signal is interrogated to indicate the presence of an interfile gap when the tape is operating in a fast search mode of 90 inches per second. FSENABLE is the signal that enables a timing one-shot that generates FILFND.</p>
F.G. HEATER	<p><b>FLOOD GUN HEATER VOLTAGE</b></p> <p>The flood gun heater voltage is a zener regulated voltage of +40 volts above the -20 volt unregulated supply. It is used to heat the filaments in the crt flood guns.</p>
FMARK	<p><b>FILE MARK</b></p> <p>This signal is generated by the intercharacter gap (ICG) counter when reading the tape and a file mark has been encountered. A file mark consists of 8 consecutive intercharacter gaps separated by flux reversals on track 0 — one reversal between each ICG.</p>
FSENABLE	<p><b>FAST SEARCH ENABLE</b></p> <p>This signal, when true, enables the detection of an interfile gap when the tape is operating in a fast search mode of 90 inches per second.</p>
GICG	<p><b>GENERATE INTERCHARACTER GAP</b></p> <p>This signal enables the selected operation trigger (SOT) to become the magnetic tape write clock (WCLK) when generating intercharacter gaps. GICG also forces a data write to track zero by holding WDATA false.</p>
GND	<p><b>GROUND</b></p> <p>This is the electrical common or zero potential (chassis voltage) in the 4051.</p>

## APPENDIX A

HALT	<p><b>HALT</b></p> <p>This signal is generated by the 4051 system test fixture to stop the operation of the microprocessor. When the microprocessor is stopped, VMA is false, BA is true, and the three-state signals, R/W, address lines and data lines are at a high impedance state. HALT is also used by the 4051 system test fixture to single-step through microprocessor instructions.</p>
IFC	<p><b>INTERFACE CLEAR</b></p> <p>This general purpose interface bus (GPIB) signal is asserted by the 4051 to force all devices on the bus to a predetermined quiescent state. The INIT statement in the 4051 BASIC language will cause the IFC line to become active. The 4051, being the only controller and therefore the system controller, is the only source for this signal.</p>
INTER	<p><b>INTERROGATE</b></p> <p>This signal is produced by an optional Hard Copy Unit to strobe the crt writing beam (Z axis) while generating a copy of the displayed image. Each time the strobed writing beam lands on a written portion of the crt image, a target signal (TARSIG) is generated and transmitted back to the Hard Copy Unit.</p>
I/O	<p><b>INPUT/OUTPUT INDICATOR</b></p> <p>This signal is used to turn on the I/O signal light anytime a device input/output operation (data transfer) is performed.</p>
IPIAS	<p><b>INTERNAL PERIPHERAL INTERFACE ADAPTER SELECT</b></p> <p>This signal is generated by the read only memory (ROM) page decoder and goes true whenever data on the address bus specifies that a valid internal peripheral address may be present. Internal peripheral interface adapters (PIAs) are located on the cpu board.</p>
IRQ	<p><b>INTERRUPT REQUEST</b></p> <p>This line is a maskable interrupt request line to the microprocessor.</p>
KBCLK	<p><b>KEYBOARD CLOCK</b></p> <p>This signal increments a data decoding counter used to interrogate and decode the particular alphanumeric key being pressed. The clock is generated as an output from the random access memory (RAM) refresh counter.</p>
KBCOPY	<p><b>KEYBOARD COPY</b></p> <p>This signal is used only by the 4006-1 Display Terminal to initiate a hard copy request.</p>

KBHALT	<p><b>KEYBOARD HALT</b></p> <p>This is a signal generated by the keyboard interface to stop the keyboard decoding counter until its contents can be read. The count is placed on the key code lines (KC0 through KC6) to specify which key has been pressed. After the microprocessor has read the key code, the KBHALT line again goes false.</p>
KC0 thru KC6	<p><b>KEY CODE LINES</b></p> <p>Data found on these lines specifies which keyboard key has been pressed. Data on these lines becomes stable when the microprocessor issues a KBHALT command to the keyboard. Data on KC0 thru KC6 is converted into ASCII format by the microprocessor for BASIC data processing.</p>
KEY	<p><b>KEY DOWN</b></p> <p>This signal goes true whenever a key on the keyboard is pressed.</p>
LAMP ON	<p><b>LAMP ON</b></p> <p>This signal is used to turn on the tape sensing lamp when the tape cartridge is inserted into the instrument. Illumination from the lamp is used to activate phototransistors that generate UPHOLE and LOHOLE signals.</p>
LAMP ON RETURN	<p><b>LAMP ON RETURN</b></p> <p>This signal is used by logic to sense that a cartridge tape unit has been inserted into the 4051. The tape drive motor is disabled unless the sensing lamp is on and a tape cartridge is inserted into the system.</p>
LBS	<p><b>LOAD BANK SWITCH</b></p> <p>This signal is generated whenever the bank switch memory location is addressed. Data written into the bank switch register indicates which 8K ROM bank is selected to use the shared ROM address space. The data also determines which of several possible external interfaces may be activated.</p>
LDCLK	<p><b>LOAD CLOCK</b></p> <p>This signal is activated whenever the 4051 wishes to perform tape input/output operations and the LOAD line is false. A false on the LOAD line indicates that there is no tape in true only if a tape cartridge has been loaded into the 4051. The LOAD line will remain true until the tape cartridge is removed.</p>

## APPENDIX A

LOAD	<p><b>LOAD</b></p> <p>This signal is used by the microprocessor through the keyboard PIA to determine if a tape cartridge is loaded and available to perform input/output operations.</p>
LOADED	<p><b>LOADED</b></p> <p>This signal is generated by a microswitch in the 4051 to indicate that a tape cartridge is currently in the system.</p>
LOHOLE	<p><b>LOWER HOLE INDICATOR</b></p> <p>This signal is generated by a phototransistor as light shines through the lower magnetic tape hole, right side of tape. LOHOLE is used to decode beginning of tape (BOT) and end of tape (EOT).</p>
MAB0 thru MAB11	<p><b>MULTIPLEXED ADDRESS BUS</b></p> <p>These signal lines are outputs from the random access memory (RAM) refresh multiplexer. When MCP2 is false, a memory refresh address is on the MAB address lines. When MCP2 is true, memory data address from the microprocessor (or 4051 system test fixture) is on the MAB address lines. The MAB address lines are used to address the contents of random access memory (RAM) devices and also to provide RAM refresh addressing.</p>
MAKE COPY	<p><b>MAKE COPY</b></p> <p>This signal is generated on the display board and is sent to an optional Hard Copy Unit whenever a copy is to be made.</p>
MCP1	<p><b>MASTER CLOCK PHASE 1</b></p> <p>This is the phase 1 clock for the microprocessor. It is generated as a fixed number of pulses from a crystal oscillator.</p>
MCP2	<p><b>MASTER CLOCK PHASE 2</b></p> <p>This is the phase 2 clock for the microprocessor. It is also used for peripheral timing and memory timing operations. MCP2 is generated as a fixed number of pulses from a crystal oscillator.</p>
MDATA	<p><b>MORE DATA</b></p> <p>This signal is generated by the tape cartridge clocking circuitry to request more data to be written to the tape. It is also used to enable the load and shift operations of a parallel-in serial-out shift register.</p>
MTCLK	<p><b>MAGNETIC TAPE CLOCK</b></p> <p>This signal is generated by a counter in the master timing circuits. MTCLK is used to drive the clock control circuitry that writes data to the magnetic tape cartridge.</p>

NDAC	<p><b>NOT DATA ACCEPTED</b></p> <p>This is a handshake control line on the general purpose interface bus (GPIB). Its true state indicates that data is not accepted. Listener devices cause this line to go false to signal an acceptance of data in response to DAV.</p>
NMI	<p><b>NON-MASKABLE INTERRUPT</b></p> <p>This is a high priority interrupt used by the cartridge tape control logic to request service of the microprocessor. This interrupt cannot be disabled within the microprocessor.</p>
NOBURN CLK	<p><b>NO BURN CLOCK</b></p> <p>This is a 12.5% duty cycle clock signal used to reduce writing beam energy when the 4051 draws short vectors. This prevents phosphor burns resulting from concentrated writing energy. The NOBURN CLK signal is generated by the system timing circuits.</p>
NODRIVE	<p><b>NO TAPE DRIVE</b></p> <p>This signal is the inverse of DRTAPE to indicate that the magnetic tape motor is not being driven. It is used to disable the writing circuits when the tape is not moving.</p>
NRFD	<p><b>NOT READY FOR DATA</b></p> <p>This is a handshake signal used by the general purpose interface bus (GPIB) to indicate that a listener is not ready for data. The false state indicates that a listener is ready to receive more data.</p>
OFA	<p><b>OVERFLOW A</b></p> <p>This signal is generated in the Firmware Backpack whenever the first overflow read only memory device is addressed.</p>
OFB	<p><b>OVERFLOW B</b></p> <p>This signal is generated in the Firmware Backpack whenever the second overflow read only memory device is addressed.</p>
ORIGIN	<p><b>ORIGIN SHIFT CLOCK</b></p> <p>This signal line is pulsed each time the page (or crt display) is erased. ORIGIN clocks a counter that determines the zero address offset for a new page of displayed information.</p>
PIAE	<p><b>PERIPHERAL INTERFACE ADAPTER ENABLE</b></p> <p>This signal is true when both VMA from the microprocessor and MCP2 from the master clock circuits are true. PIAE is used as a timing or enable pulse for peripheral interfaces such as PIAs and ACIAs.</p>

## APPENDIX A

PIAS	<p><b>PERIPHERAL INTERFACE ADAPTER SELECT</b></p> <p>This signal goes true whenever the address on the address bus lies within the peripheral interface address space. This decoded address signal is used to generate IPIAS and EPIAS.</p>
RAMP	<p><b>RAMP</b></p> <p>The voltage on this analog signal line determines the speed of the tape motor and therefore the cartridge tape velocity. The RAMP voltage is determined by an integrator circuit on the motor drive board. Tape velocity is approximately 10 inches per second for each volt of RAMP voltage.</p>
RAMS0 thru RAMS7	<p><b>RANDOM ACCESS MEMORY SELECT</b></p> <p>Each of the RAMS lines is generated by an address decoder. Each line enables 4K bytes of random access memory composed of eight 4K RAM chips. RAM blocks 0 and 1 are on the cpu board. RAM blocks 2 thru 7 are on the expanded memory board.</p>
RAMW	<p><b>RANDOM ACCESS MEMORY WRITE</b></p> <p>This signal causes a write operation to be performed on random access memory (RAM) devices within the 4051. It goes true whenever a write operation is commanded on R/W from the microprocessor and MCP2 is true. It also goes true if the 4051 system test fixture issues a write command, RWOC, during MCP2.</p>
RBC	<p><b>ROM BANK CONTROL</b></p> <p>This signal is generated by the bank switch data decoder in a backpack to disable the 8K ROM bank on the cpu board whenever another ROM bank that shares the same address space is selected.</p>
RCCLK	<p><b>RANDOM ACCESS MEMORY COUNTER CLOCK</b></p> <p>This signal is generated by the master clock circuitry to periodically advance the random access memory refresh address counter. The counter cycles the refresh addresses associated with address lines MAB0 thru MAB5.</p>
RCE0 thru RCE7	<p><b>RAM CHIP ENABLE</b></p> <p>Each RCE line goes to chip enable inputs of a 4K block of RAM and is activated at the appropriate time for input/output operations and memory refresh operations. During RAM input/output operations, only one of the eight RCE lines is active. During memory refresh, REFCLK0 activates RCE0 and RCE1, REFCLK1 activates RCE2 thru RCE4, and REFCLK2 activates RCE5 thru RCE7.</p>

RCLK	<p>READ CLOCK</p> <p>This signal is generated by data being read from the internal magnetic tape. RCLK is used to clock the serial tape data into the serial-to-parallel shift register. It is also interrogated by one shots to decode the various tape formatting patterns (i.e., intercharacter gaps, record marks, file marks and interfile gaps).</p>
MRDATA	<p>MAGNETIC READ DATA</p> <p>This signal is serial data recovered from the tape during a read operation. On the cpu board it is converted to 8-bit parallel data for use by the microprocessor.</p>
RDATA	<p>RECEIVE DATA</p> <p>When the 4051 acts as a data set, the signal transmitted at pin 3 of the RS-232 connector on the Communication Backpack is data to be received by a data terminal.</p> <p>When the 4051 acts as a data terminal, RDATA becomes <b>Transmit Data</b> on pin 2 of the RS-232 communication cable. This data is sent to data communication equipment.</p>
RDBYTE	<p>READ BYTE</p> <p>This signal goes true during a magnetic tape read operation when 8 bits of data have been loaded into the read data register, a serial-in parallel-out shift register. RDBYTE informs the microprocessor to read the data currently in the read data register.</p>
RDE	<p>RAM DECODE ENABLE</p> <p>This signal is generated by the master timing circuitry to enable the decoding of a random access memory (RAM) address during a specified time period (the last 480 nanoseconds of MCP2).</p>
READ	<p>READ</p> <p>This signal is generated by an optional Hard Copy Unit and goes true whenever the Hard Copy Unit is making a copy of the image on the crt.</p>
REFCLK0 REFCLK1 REFCLK2	<p>REFRESH CLOCK SIGNALS</p> <p>These clock signals are generated by the master clock circuits to time the refresh activity for random access memory (RAM) devices. Each clock signal initiates refresh activity for a bank of RAMs.</p>

## APPENDIX A

REN	<p>REMOTE ENABLE</p> <p>The 4051 places this signal on the general purpose interface bus (GPIB) whenever the BUSY light is lit. This signal places all devices on the GPIB under control of the 4051, causing these devices to ignore their front panel controls.</p>
RES	<p>RESET</p> <p>This signal is a buffered data line from the RESTART signal. This signal resets all interface devices and restarts the microprocessor programming.</p>
RESTART	<p>RESTART</p> <p>This signal is generated by the +5 volt power supply during 4051 power-up operations. It can also be generated by the 4051 system test fixture.</p>
REV	<p>REVERSE</p> <p>This signal controls the direction of tape drive operation. When true, the tape travels in the backward direction when the tape unit is ordered into motion. When false, the tape travels in the forward direction.</p>
RMARK	<p>RECORD MARK</p> <p>This signal interprets the pulses from the intercharacter gap counter to determine when a record mark on tape has been read. A record mark is four successive intercharacter gaps separated only by flux reversals on track 0. There is one flux reversal between each intercharacter gap.</p>
ROMDIS	<p>READ ONLY MEMORY DISABLE</p> <p>This signal is generated by the 4051 system test fixture to disable the ROME15 signal. When ROMDIS is true, the address space associated with ROME15 is used by memory devices within the 4051 system test fixture.</p>
RTS	<p>REQUEST TO SEND</p> <p>The 4051 cannot act as a half-duplex data set. RTS is a half-duplex control signal received on pin 4 of the RS-232 connector on the Communication Backpack.</p> <p>When the 4051 acts as a half-duplex data terminal, RTS becomes <b>Clear To Send</b> on pin 5 of the RS-232 communication cable. CTS is transmitted as <b>Request To Send</b> whenever the 4051 needs to transmit data. RTS is received as <b>Clear To Send</b> whenever it is ok for the 4051 to transmit data. This is half-duplex normal operation.</p>

R/W	<p><b>READ/WRITE</b></p> <p>This signal is generated by the microprocessor to control direction of data flow on the data bus. When R/W is true, the microprocessor reads data that has been placed on the data bus by peripheral interfaces or memory. When R/W is false, the microprocessor places data on the data bus to be written into memory or a peripheral interface.</p>
RWIC1 and RWIC2	<p><b>READ-WRITE INPUT COMMAND</b></p> <p>These signals are contained entirely within an integrated circuit chip. They are used to place random access memory (RAM) output data onto the data bus whenever a RAM read operation is performed.</p>
RWOC	<p><b>READ-WRITE OUTPUT COMMAND</b></p> <p>This signal is the buffered R/W line from the microprocessor. It is used by all devices that are inserted into the backpack slots.</p> <p>The 4051 system test fixture also activates this line when the microprocessor is halted to examine or deposit data in memory locations within the 4051.</p>
SA0 thru SA7	<p><b>SELECTED DATA BUS A</b></p> <p>This data bus is used to receive data from the magnetic tape. The bus consists of the PA data lines on the Y axis D/A peripheral interface adapter.</p>
SAFE	<p><b>SAFE</b></p> <p>This signal is generated by the magnetic tape microswitch that indicates whether the tape cartridge is write protected. The true state of the SAFE signal prevents data from being written to the tape cartridge.</p>
SAFE SW	<p><b>SAFE SWITCH</b></p> <p>This switch is open when a tape cartridge is write-protected. This switch is closed to attach the +15 V<sub>I</sub> supply voltage to the tape writing circuits.</p>
SB0 thru SB7	<p><b>SELECTED DATA BUS B</b></p> <p>This data bus is used to send data bytes to the magnetic tape. The bus consists of the PB data lines on the Y axis D/A peripheral interface adapter.</p>
SHIFT	<p><b>SHIFT</b></p> <p>This signal is generated by the keyboard whenever the SHIFT key is pressed.</p>

SOT	<p><b>SELECTED OPERATION TRIGGER</b></p> <p>This signal is generated by a peripheral interface adapter to implement several timing functions.</p> <ol style="list-style-type: none"><li>1. SOT triggers a refreshed dot during the display of a cursor or refreshed character on the crt.</li><li>2. SOT becomes the WCLK signal whenever an intercharacter gap (GICG) is to be written to the magnetic tape.</li><li>3. SOT triggers a 40 microsecond timer on the tape drive board by activating the DELAY IN signal. After initiating SOT, the microprocessor can monitor DELAY OUT to determine when 40 microseconds has elapsed. The 40 microsecond timer is used to control functions such as generating intercharacter gaps on magnetic tape, line turn-around timing in half-duplex communications and status response timing in 4012 Display Terminal emulation.</li></ol>
SPEAKER	<p><b>SPEAKER</b></p> <p>This is a filtered return line for the BUSY signal as it passes through a speaker for generating an audio tone.</p>
SRQ	<p><b>SERVICE REQUEST</b></p> <p>This is a control line that is activated by a peripheral device on the general purpose interface bus (GPIB) to request service from the microprocessor (system controller). The 4051 responds to SRQ by performing a serial poll of devices on the GPIB.</p>
SRX	<p><b>SECONDARY RECEIVED LINE SIGNAL DETECTOR</b></p> <p>This signal is found on pin 12 of the RS-232 connector on the Communication Backpack. It is also on pin 12 of the RS-232 communication cable. When the 4051 acts as a half-duplex data terminal using supervisor communications, the signal received on SRX indicates that the computer or data set is listening for data. When SRX goes false, the computer or data set wishes to send data to the 4051.</p>
STXA STXC	<p><b>SECONDARY REQUEST TO SEND (RS-232-A)</b> <b>SECONDARY REQUEST TO SEND (RS-232-C)</b></p> <p>STXA is transmitted by the 4051 on pin 11 of the RS-232 connector on the Communication Backpack or the end of the communication cable. STXC is transmitted by the 4051 on pin 19 of the RS-232 connector on the Communication Backpack or the end of the</p>

communication cable. When the 4051 acts as a half-duplex data terminal using supervisory communications, the signal transmitted on STXA or STXC is true whenever the 4051 is listening for data. STXA or STXC is false whenever the 4051 wishes to transmit data. When STXA or STXC is false, the 4051 must wait for SRX to become true before transmitting data. This is half-duplex supervisory communications.

TALK	<p>TALK</p> <p>This signal goes true whenever the 4051 wishes to transmit data over the general purpose interface bus (GPIB). TALK goes false whenever the 4051 listens to data on the GPIB. TALK provides an enable signal for line buffers on the data lines (DIO1 thru DIO8) and handshake lines (DAV, NRFD and NDAX).</p>
TARSIG	<p>TARGET SIGNAL</p> <p>This signal is generated by the crt readout amplifier when a hard copy is being created by an optional Hard Copy Unit. During hard copy operation, the crt writing beam is being strobed. Whenever the writing beam lands on a stored (written) portion of the display, TARSIG momentarily goes true and is used by the Hard Copy Unit to indicate the presence of displayed information at any given location.</p>
TDATA	<p>TRANSMIT DATA</p> <p>When the 4051 acts as a data set, the signal received on pin 2 of the RS-232 connector on the Communication Backpack is serial data transmitted from a computer terminal to the 4051.</p> <p>When the 4051 acts as a data terminal, TDATA becomes <b>Receive Data</b> on pin 3 of the RS-232 connector on the RS-232 communication cable. It is used to receive data from a computer or data communication equipment.</p>
TNIM	<p>TAPE NOT IN MOTION</p> <p>This signal is generated by the magnetic tape motor drive circuits to indicate that the tape has stopped.</p>
TTY	<p>TELETYPE LOCK</p> <p>This signal is generated by the TTY LOCK key on the keyboard. When the TTY LOCK key is down TTY is true and an abbreviated ASCII character set is selected. TTY being false indicates that the TTY LOCK key is up and the full printable ASCII character set is enabled. Decoding of ASCII characters is performed by the microprocessor.</p>

## APPENDIX A

TUTS	<p><b>TAPE UP TO SPEED</b></p> <p>This signal is generated by the motor drive circuitry to indicate that the tape motor is up to operating speed of 30 or 90 inches per second.</p>
UPHOLE	<p><b>UPPER HOLE</b></p> <p>This signal is generated by a phototransistor as light shines through the upper magnetic tape hole, left side of tape. UPHOLE is used to decode beginning of tape (BOT), the tape load point and the early warning hole near the end of tape.</p>
VECTOR	<p><b>VECTOR</b></p> <p>This signal is generated by data from a peripheral interface adapter to enable vector generation. When true, VECTOR activates the filters on the digital-to-analog converter outputs. VECTOR also enables the VPULSE one shot.</p>
VEN	<p><b>VECTOR ENABLE</b></p> <p>This signal is generated by data from a peripheral interface adapter to enable the drawing of a vector on the crt. VEN disables the alphanumeric timing one shots and enables the writing beam (Z axis) to turn on during vector generation.</p>
VIEW	<p><b>VIEW</b></p> <p>This signal is generated on the cpu board to control the crt flood gun anode voltage. When VIEW is true, the flood gun anode is at +150 volts. When false, the flood gun anode is at zero volts. When the cpu board asserts view mode operation, VIEW is true. When the cpu board asserts hold mode operation, VIEW is activated by a low duty-cycle square wave.</p>
VIEWCAUSE	<p><b>VIEW CAUSE SIGNAL</b></p> <p>This signal is generated by a 100 second view timer on the cpu board. VIEWCAUSE is triggered each time the shift key is pressed or each time data is loaded into the digital-to-analog converter circuits.</p>
VMA	<p><b>VALID MEMORY ADDRESS</b></p> <p>This signal is generated by the microprocessor when a memory address is placed on the address bus.</p>
VPULSE	<p><b>VECTOR PULSE</b></p> <p>This is a 3.7 millisecond pulse that provides the vector drawing time signal. The signal goes true whenever a vector is being generated regardless if it is displayed or not.</p>

WAIT	<p><b>WAIT</b></p> <p>This signal is generated by Hard Copy Units that have a multiplexer option. The signal goes true whenever a Hard Copy Unit is currently making a copy from another crt display when the 4051 initiates a copy request. The WAIT signal is used to hold display modification activity until a hard copy has been made of the crt in the 4051.</p>
WCLK	<p><b>WRITE CLOCK</b></p> <p>This signal is generated by the magnetic tape write control circuitry driven by MTCLK on the cpu board. WCLK is used to clock data onto the magnetic tape within the 4051.</p>
WDATA	<p><b>WRITE DATA</b></p> <p>This is serial data to be written to the internal magnetic tape. This data is unpacked from a parallel-in serial-out shift register on the cpu board and is strobed onto the magnetic tape by the write clock, WCLK.</p>
WENABLE	<p><b>WRITE ENABLE</b></p> <p>This signal is generated as data from a peripheral interface adapter to enable magnetic tape writing activity. WENABLE determines whether the write clock signal (WCLK) can be generated and whether data can be loaded into the write data shift register.</p>
WR	<p><b>WRITE</b></p> <p>This signal is generated as data from a peripheral interface adapter to select the read/write circuits on the tape drive board. When WR is true, data may be written or stored onto a tape cartridge. When WR is false, data may be read from a tape cartridge.</p>
X	<p><b>X AXIS ANALOG SIGNAL</b></p> <p>This signal is the X axis deflection voltage from the filter whose input is X D/A. If vectors are to be drawn, then X D/A is passed through an active RC filter network before becoming X. X voltage range is approximately +8 volts at the left of the screen and -8 volts at the right of the screen.</p>
X AMP	<p><b>X AXIS AMPLITUDE</b></p> <p>This signal is generated by the display multiplexer circuits on the display board. Inputs to the circuitry are X HC RAMP IN from a Hard Copy Unit and X from the cpu board. X AMP is used to drive the deflection amplifiers and the correction circuitry for geometry and focus.</p>

## APPENDIX A

X CHAR D/A	<p><b>X CHARACTER DIGITAL TO ANALOG</b></p> <p>Character positioning is determined by a primary digital-to-analog converter while column selection within a character is determined by X CHAR D/A.</p>
X D/A	<p><b>X DIGITAL TO ANALOG</b></p> <p>This signal is the output from the X axis digital-to-analog converter amplifier. X D/A is selectively filtered to determine writing beam deflection and is used directly as a voltage comparison with a Joystick output voltage.</p>
XERR	<p><b>X AXIS JOYSTICK ERROR</b></p> <p>This signal is generated by a comparison amplifier using X D/A and X JOY as input voltages. The state of XERR is examined by the microprocessor to determine the location referenced by the Joystick.</p>
X HC RAMP IN	<p><b>X AXIS HARD COPY RAMP INPUT</b></p> <p>This signal is generated by an optional Hard Copy Unit to drive the X axis writing beam deflection while creating a hard copy of the image displayed on the crt.</p>
X JOY	<p><b>X JOYSTICK VOLTAGE</b></p> <p>This signal line has a position reference voltage generated by an optional Joystick that can be used for graphic input applications.</p>
XPC2 thru XPC4	<p><b>EXTERNAL PERIPHERAL CONTROL LINES</b></p> <p>Each line is a decoded address of a possible external peripheral interface adapter (PIA). These lines can be used to address special interfaces placed into backpack slots or ROM Expander Unit slots. In order for an interface in a backpack slot to be activated, its slot should be previously selected by bank switch circuitry.</p>
Y	<p><b>Y AXIS ANALOG SIGNAL</b></p> <p>This signal is the Y axis deflection voltage from the filter whose input is Y D/A. If characters are drawn, the filter is disabled and Y becomes Y D/A. If vectors are to be drawn, then Y D/A is passed through an active RC filter network before becoming Y. Y voltage range is approximately +8 volts at the top of the screen and -8 volts at the bottom of the screen.</p>
Y AMP	<p><b>Y AXIS AMPLITUDE</b></p> <p>This signal is generated by the display multiplexer circuits on the display board. Inputs to the circuitry are Y HC RAMP IN from a Hard Copy Unit and Y from the cpu board. Y AMP is used to drive the deflection amplifier and correction circuitry for geometry and focus.</p>

Y CHAR D/A	<p><b>Y CHARACTER DIGITAL TO ANALOG</b></p> <p>Character positioning is determined by a primary digital-to-analog converter while row selection within a character is determined by Y CHAR D/A.</p>
Y D/A	<p><b>Y DIGITAL TO ANALOG</b></p> <p>This signal is the output from the Y axis digital-to-analog converter amplifier. Y D/A is selectively filtered to determine writing beam deflection and is used directly as a voltage comparison with a Joystick output voltage.</p>
YERR	<p><b>Y AXIS JOYSTICK ERROR</b></p> <p>This signal is generated by a comparison amplifier using Y D/A and Y JOY as input voltages. The state of YERR is examined by the microprocessor to determine the location referenced by the Joystick.</p>
Y HC RAMP IN	<p><b>Y HARD COPY RAMP INPUT</b></p> <p>This signal is generated by an optional Hard Copy Unit to drive the Y axis writing beam deflection while creating a hard copy of the image displayed on the crt.</p>
Y JOY	<p><b>Y JOYSTICK VOLTAGE</b></p> <p>This signal line has a position reference voltage generated by an optional Joystick that can be used for graphic input applications.</p>
Z	<p><b>Z AXIS SIGNAL</b></p> <p>This signal is generated by the cpu board to control the state of the writing beam. Z becomes Z MPX on the display board if a hard copy is not being made. If Z is true, the writing beam of the crt will turn on. If false, the writing beam will remain off.</p>
Z MPX	<p><b>Z AXIS MULTIPLEXED SIGNAL</b></p> <p>This signal is generated on the display board to drive the writing beam circuits (Z axis amplifier). When a hard copy is to be generated, Z MPX is triggered by INTER. Otherwise, Z MPX is equal to Z.</p>
Z VECT	<p><b>Z VECTOR DRAW</b></p> <p>This signal is generated by vector generation circuitry on the cpu board to turn on the writing beam for the duration of a vector draw. The Z signal is controlled by Z VECT as well as outputs of character dot one shots.</p>
