

# M1709 OMNIBUS INTERFACE FOUNDATION MODULE

PDP-8/e, -8/f,  
-8/m  
OMNIBUS  
M SERIES

Length: Extended  
Height: Quad  
Width: Single

Price:  
\$125

Printed Ckt. Rev.: B  
Ckt. Schem. Rev.: A  
Printed: August 1972

Board Size:  
L—Extended  
H—Quad  
W—Single  
No. Slots: 4  
Price: \$125.00

Volts	Power mA (max.)	Pins
+5	830	AA2, BA2, CA2
GND		All pins CNFT

## DESCRIPTION

The M1709 OMNIBUS Interface Foundation module is a generalized interface card that is constructed to allow the user to build a custom design using integrated circuits (ICs) which can be directly inserted into the OMNIBUS. All required OMNIBUS Interface logic, i.e., bus drivers/receivers, device selectors, and interrupt/skip circuitry is provided. IC mounting pads with wire-wrappable pins are made available for custom circuitry. Pads accommodate all common types of Dual-In-Line Pack (DIP) ICs with up to forty pins.

Connection to user equipment is made via standard cables (BC088 or BC042) that plug directly into the M1709 module board. The HSS1 card edge connector, allows several M1709 modules or W986/W967 wire-wrappable modules to be strapped together to accommodate more extensive designs.

## APPLICATIONS

Since both analog and digital circuitry are available in DIP form, quite complex systems may be built. Some of the typical applications for the M1709 module are:

- Multibit input and/or output
- Instrument interfaces
- Interprocessor communication
- Oscilloscope controller (D/A)
- Peripheral control (data terminals, etc.)
- Interfacing of:

- A/D converters
- Multiplexers
- Counters
- Shift registers
- Read-Only Memories (ROMs)
- Arithmetic Logic Units (ALU)

## FUNCTIONS

The preassembled circuitry of the M1709 module can be classified into four categories: Device and Function Selection, Data Bus Interface, Interrupt and Skip Interface, and Control Line Interface.

**Device and Function Selection:** Device address decoding is performed with a pair of binary-to-octal decoders (3 to 8 line). OMNIBUS lines MD09 through MD16 are decoded and one output of each decoder is ANDed (by wire-wrapping) to sense a "device selected" condition. Any code from 01<sub>2</sub> to 77<sub>2</sub> is selectable via wire-wrap jumper selection.

The "device selected" condition is, in turn, ANDed with the I/O PAUSE signal to drive the OMNIBUS signal INTERNAL I/O. This signal is also made available at a wire-wrap pin as SELECT H.

Function decoding is performed by a binary-to-octal decoder (3 to 8 line). OMNIBUS signals MD09 through MD11 are decoded to form the eight IOT 0 through IOT 7 signals. These TTL signals are made available at numbered wire-wrap pins for ease of connection to user-installed IC logic.

**Data Bus Interface:** The 12 OMNIBUS Data Lines, DATA 00 through DATA 11, are received with special high-impedance circuitry and TTL signals are made available at wire-wrap pins. In addition, each data line has a special BUS driver circuit assigned to it. Input to these drivers is available at wire-wrap pins and is TTL-compatible for direct connection to user-installed IC logic.

Enable inputs are provided for both data line receivers and drivers.

**Interrupt and Skip Interface:** BUS driver circuits are available for driving the OMNIBUS INT REQUEST and SKIP lines. The INT REQUEST driver has an enabling input which can be used to inhibit the interrupt request while maintaining the ability to test the interrupt condition via the SKIP facility. Input to these drivers is TTL-compatible and made via wire wrap pins.

**Control Line Interface:** BUS driver circuits are connected for asserting the three OMNIBUS data transfer mode signal lines—C<sub>1</sub>, C<sub>2</sub>, C<sub>3</sub>. Input to these drivers is TTL-compatible and made via wire wrap pins.

**Miscellaneous Interface Signals:** OMNIBUS signals TP3 and INITIALIZE are received with high impedance circuits. These signals are made available in TTL-compatible form at wire wrap pins as RTP3 and RINIT, respectively. A source of +3 volts is made available at a wire wrap pin.

#### **OMNIBUS Signals made Available to the User\***

In addition to those OMNIBUS signals mentioned previously, the following 40 OMNIBUS signals are made available to the user at wire wrap pins. The complete set of signals available is sufficient to allow the user to accomplish all program transfer and data break interface operations.

OMNIBUS Signal Name	Pin
NA0	A01
NA1	A02
NA2	A03
NA3	A04
ND0	A05
ND1	A06
ND	A07
ND DIR	A08
NA4	B01
NA5	B02
NA6	B03
NA7	B04
ND6	B05
ND7	B06
INT STROBE	B07
BREAK IN PROG	B08
MA, MS LOAD CONT	B09
OVERFLOW	B10
BREAK DATA CONT	B11
BREAK CYCLE	B12
BUS STROBE	C01

\*These OMNIBUS signals (except ± 15 V) require high impedance/low leakage current driving and receiving circuitry. Use DDC 380 and 381 ICs.

OMNIBUS Signal Name	Pin
NOT LAST XFER	CM1
CPMA DISABLE	CU1
MS, IR: DISABLE	CV1
TP1	CD2
TP2	CE2
TP3	CH2
TP4	CJ2
T81	CK2
TS2	CL2
TS3	CM2
TS4	CP2
LINK DATA	CR2
LINK LOAD	CS2
MA8	DD1
MA9	DE1
MA10	DH1
MA11	DJ1
+15 V	DA2
-15 V	DB2

#### SPECIFICATIONS

Signals to and from the OMNIBUS are received or driven with special high impedance circuitry to minimize bus loading.

#### CAUTION

All requirements for timing should be in accordance with the PDP-8/e and 48/i Small Computer Handbook.

All signals to and from external equipment or user-installed IC logic must be standard TTL-compatible levels.
