1. ABSTRACT

This program is a Memory Data Validity Test to be used after a simulated power failure.

2. REQUIREMENTS

Storage

Memory locations 0001<sub>8</sub>--7477<sub>8</sub>

Subprogram and/or Subroutines

RIM

Binary Loader

Equipment

PDP-8 Processor, keyboard reader, and Teleprinter

3. <u>USAGE</u>

3.1 Loading

Normal binary tape loading procedures are to be used with this program.

3.2 Start up and/or Entry

Load address 0014 and press START.

The program should then halt at 00428.

Load address 0001 and press START.

The program should now loop.

3.3 Errors in Usage

Errors detected by the program cause the program to halt at memory address  $0055_8$ . The contents of memory addresses  $0011_8$  and  $0012_8$  indicate the addresses of the data that failed to check-sum Memory addresses  $0007_8$  and  $0010_8$  contain the data words that failed to check-sum.

Lower Address =  $(0011_8) = 100_8 - 3677_8$ 

Upper Address =  $(0012_8) = 3700_8 - 7477_8$ 

Lower Error Word =  $(0007_8) = 2525_8$ 

Upper Error Word =  $(0010_8)$  52528

3.4 Error Recovery

Press CONTINUE to test for other error words in memory.

Reload address 00208 to restart the entire program.

#### 4. DESCRIPTION

#### 4.1 Discussion

This program tests memory for bit drop out and pick up after a simulated power failure has occurred.

By starting the program at memory address 0014<sub>8</sub>, data words consisting of 2525<sub>8</sub> are written into memory locations 0100<sub>8</sub>--3677<sub>8</sub>, and the data words consisting of 5252<sub>8</sub> are written into memory locations 3700<sub>8</sub>--7477<sub>8</sub> after which the program halts at memory address 0042<sub>8</sub>. Load address 0001 and restart the program; the program will 2's add the contents of memory location 0100<sub>8</sub> with 3700<sub>8</sub>. If the result equals 7777<sub>8</sub>, the program will 2's add the contents of memory locations 0101<sub>8</sub> with 3701<sub>8</sub>, etc. until the memory addresses of 3677<sub>8</sub> and 7477<sub>8</sub> are tested. The program stays in the 2's add compare loop until an error occurs. Concurrently cycle the power to the PDP-8 off and on. After the power has been reapplied to the PDP-8, load address 0001<sub>8</sub> and press START. If an error occurred during the power cycling, the program halts at location 0056<sub>8</sub>. The program may be restarted at memory address 0001<sub>8</sub> as many times as desired. Restart address to fill memory is 0020<sub>8</sub> not 0014.

### 4.2 Examples and/or Applications

A HALT occurs at memory address 0055<sub>8</sub>.

 $Address \qquad 0007_8 = 2505_8 \qquad (Data Word)$ 

Address  $0010_8 = 5252$  (Data Word)

Address  $0011_8 = 0101$  (Address Word)

Address  $0012_8 = 3701$  (Address Word)

Bit 7 was dropped at memory address 0101g.

## 5. EXECUTION TIME

1 msec/loop

```
