IDENTIFICATION

Product Code: DEC-08-YPPA-D
(previously, DIGITAL-8-6-U)

Product Name: Octal Memory Dump
(Octal Core Dump to Paper Tape)

Date: November 12, 1969

Maintenance
Contact: Software Information Service (CDB)

OCTAL MEMORY DUMP

Octal Core Dump to Paper Tape

1. ABSTRACT

This program enables the user to dump in octal mode any or all data in any memory field to either the Teletype or high-speed paper tape punch. During dumping, the absolute address of each location being dumped is held in the accumulator. When dumping is completed, output devices and memory fields may be changed to dump another section of memory.

2. REQUIREMENTS

2.1 Storage

This program requires one core page; initially 7400-7577.

2.2 Equipment

Any PDP-8 family computer with at least 4K words of core, an ASR-33 Teletype, and/or high-speed paper tape punch.

2.3 Software

No additional software is required. The program leaves the BIN and RIM Loaders untouched.

3. USAGE

The program is supplied in ASCII format on punched paper tape, and may be assembled by any 4K PDP-8 assembler, viz., PAL III, MACRO-8, PAL-D. The origin of this program (7400) may be changed with the PDP-8 Symbolic Editor in order to dump locations 7400-7577. (See the appropriate assembler manual for assembly instructions.)

3.1 Loading

The program is loaded into core with the Binary Loader (see DEC-08-LBAA-D or DEC-08-NGCC-D for loading procedures), and may be loaded into any available memory field.

4. OPERATING PROCEDURES

The switch register on the PDP-8 console is used to control the program. All options are taken from the position of bit Ø. The program may be interrupted by depressing the STOP switch.

With Memory Dump program in core:

1. Set the starting address and data field in the switch register and press the LOAD ADDress switch.
2. Set switch register bit Ø to 1 for a core dump to the Teletype punch, or to Ø when dumping via the high-speed paper tape punch.
3. Press the START switch. The computer will halt.
4. Set the switch register to the starting address of the section of core to be dumped.
5. Press the CONTinue switch. The computer will halt.
6. Set the switch register to the final core address of the section of core to be dumped.
7. Press the CONTinue switch; dumping commences and stops after dumping the contents of the final core address specified in step 6 above.

Another dumping session may be performed at this time by continuing at step 1 when you desire to change the output device or data field. Otherwise, continue at step 4.

The program will halt after each dumping session.

The preceding procedures are illustrated in Figure 1. on the next page.

5. ERROR MESSAGES

There are no error diagnostics or messages.

6. EXECUTION TIME

Execution (run) time is dependent on the amount of core dumped and the device used.

7. INPUT/OUTPUT

The program contains its own Teletype and high-speed punch output, and there are no external I/O handlers used. Switch register bit Ø determines the output device.

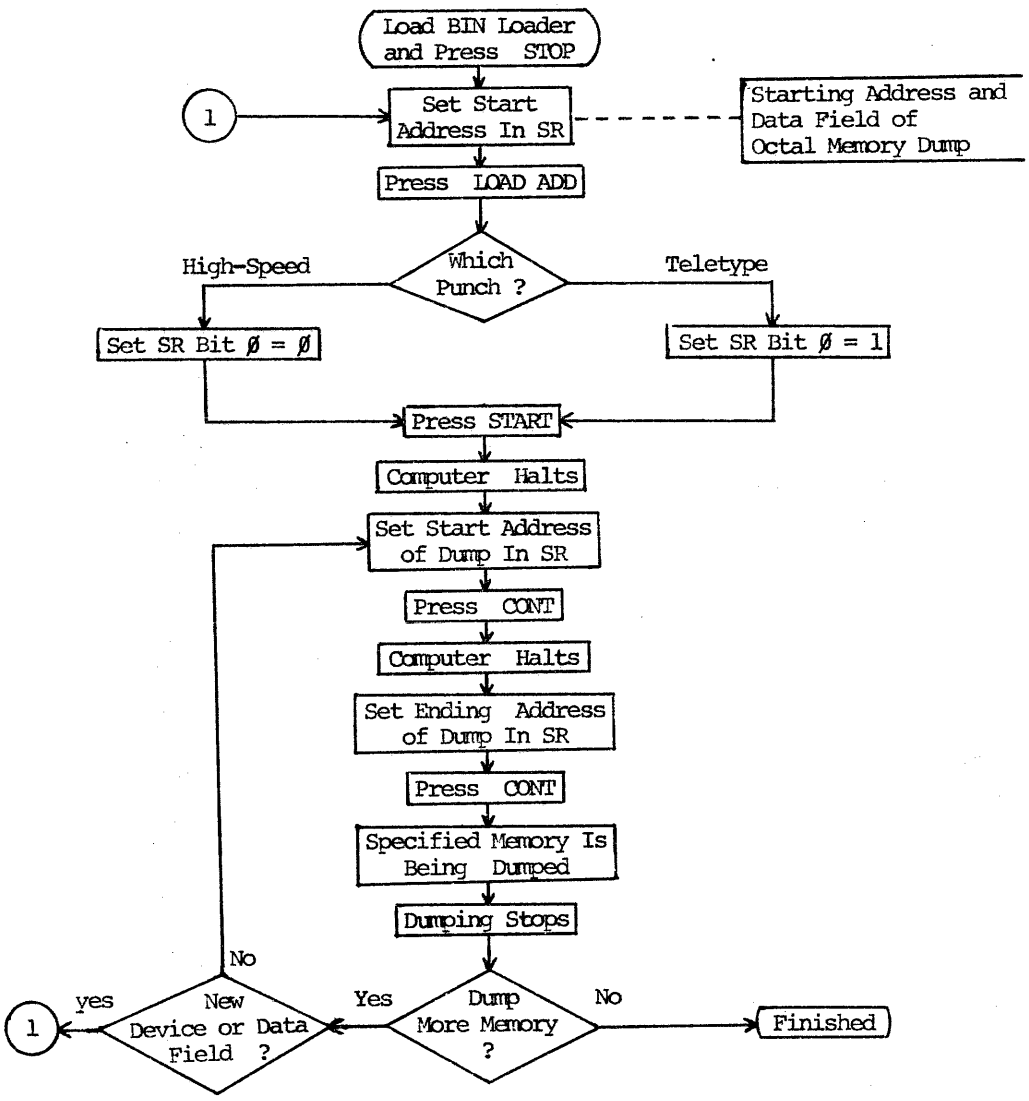

Figure 1. Operating Procedures.

8. FUNCTIONAL DESCRIPTION

The program is written in the PAL III language. Four routines are used in the program:

1. The TOCT routine causes a number to be formatted for a typeout or punchout.

2. The TCR routine outputs a carriage return-line feed.

3. The TSP routine outputs a space.

4. The TCHAR routine is the output routine for both the Teletype and high-speed punch.

The main routine begins with the initialization of variables, and the two address arguments are picked up from the switch register. Two carriage return-line feeds are performed, followed by the starting address and several spaces. A loop is then entered to type the contents of eight memory locations (if eight remain). If more data remains to be output, a JMP to LPØ2 repeats the process. If during this loop the routine finds that it has processed the last memory location, the loop exits, a carriage return-line feed is performed, a JMP to LPØØ is executed, and the program halts.

See the program listing that follows for more precise information.

9. PROGRAM LISTING

A printout of the program listing is furnished below.
